## **1.0 INTRODUCTION**

### **1.1 Background**

The purpose of this document is to provide detailed flat file specifications for RCRAInfo System translators. The legacy RCRIS (Resource Conservation & Recovery Information System) and BRS (Biennial Reporting System) national data systems are being migrated from mainframe-based FOCUS applications to a Web-based Oracle application by the Environmental Protection Agency's Office of Solid Waste (OSW).

RCRAInfo consolidates RCRIS and BRS into one national system. A data entry subsystem for the Handler Identification, Permitting, Corrective Action, and Compliance Monitoring and Enforcement subject areas is being developed and will be supported by OSW. No national data entry subsystem will be maintained as in the past for Biennial Report data. This function has been privatized. EPA Regions and States must obtain a Commercial Off-The-Shelf (COTS), Government Off-The-Shelf (GOTS) package, or develop their own software.

States and EPA Regions will continue to have the option to be translators for the RCRA hazardous waste handler identification and program activity tracking component of RCRAInfo; that is, to use their own software and procedures to extract and format data in flat file format and provide it to EPA for transfer to the national system. Two types of translators will be supported: *full* and *partial*. A *full* translator provides all of their data to EPA in standard, flat file format. A *partial* translator uses RCRAInfo to enter data for one or more subject areas (modules), and its own system for the rest.

This document is for use by translators who provide hazardous waste data for all or some of the following four subject areas: Handler Identification (HID), Permitting/Closure/Post-Closure (PMT/CL/PC), Corrective Action (CA), and Compliance Monitoring and Enforcement (CM&E). Refer to *RCRAInfo File Specification Guide--1999 Hazardous Waste Report Submissions* for information concerning providing data to EPA for the next RCRA biennial reporting cycle.

### **1.2 Overview of Document**

To be completed at a later date.

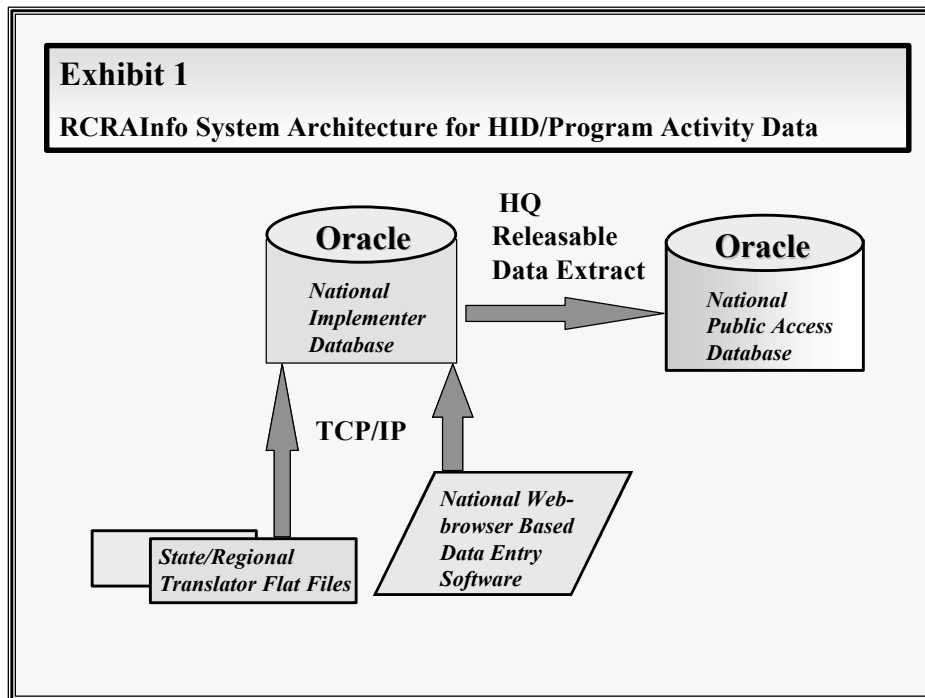

### **1.3 Translator Support**

Questions about this document should be directed to the RCRAInfo help desk at [rcrainfo.help@epa.gov](mailto:rcrainfo.help@epa.gov). Questions submitted to the help desk may only relate to the file specifications for submission of data from the States or EPA Regions which will be loaded into the RCRAInfo National Implementer Database. The RCRAInfo support staff cannot be responsible for responding to questions about translator system-specific software.

### **1.4 System Architecture**

RCRAInfo is a web-based, Oracle application. RCRAInfo utilizes a web-browser interface for data entry functions and an Oracle DBMS residing on a central EPA Unix server for data storage. In addition, OSW is using the Cool:Gen Computer Aided Software Engineering (CASE) tool from Sterling Software, Inc. to manage the communications interface between the Oracle database and the web.

**Exhibit 1 - RCRAInfo System Architecture for HID/Program Activity Data** depicts a simplified model of the RCRAInfo system architecture for the hazardous waste handler identification and program activity tracking component. A National Implementer Database will be maintained by the States and EPA Regions. *Implementers* are state and EPA regional staff who implement the RCRA program. States and Regions *co-implement (co-regulate)* the RCRA program. The National Implementer Database will contain both nationally required and implementer-specific data. *Nationally required* data (formerly called *core* data) is data needed by EPA Headquarters RCRA staff for program oversight purposes and is expected to be provided as appropriate.. All authorized RCRAInfo users in the states, regions, and at headquarters will have default READ access to all data contained in the National Implementer Database. However, national program oversight reports such as the OSW Program Accomplishments Reports (PARs) will continue to rely only on *nationally required* data. In addition, data extracts for public access purposes will pull only data designated as *nationally required* and non-enforcement sensitive.

A translator will submit flat files in the standard format described in this document. The data will be assessed and loaded into the database. How often this is done will be negotiated between a Region and State via their annual Memorandum of Agreement (MOA)/Memorandum of Understanding (MOU) process. Translators will be expected to provide data for loading into the RCRAInfo National Implementer database on at least a monthly basis.

## 1.5 Relational Database Terminology

Relational database terminology appears throughout this document. This section provides a crosswalk between relational concepts and terms utilized by previous generations of database software packages. The standard flat files to be produced by translators closely mirror the Oracle table structure of RCRAInfo.

Oracle is a relational database management system (DBMS). In a relational DBMS, data is stored in *tables*. A table is composed of *columns* and *rows*. Columns are the same as *data elements*, *fields* or *attributes*. Rows are the same as *records*. One or more columns that together uniquely identify a row are called the *key* to the table. Tables can be related to each other by a column or group of columns that contain common information. *Referential Integrity* defines a correct relationship between columns and tables in a relational database. When two tables contain common information in a column or set of columns, and those common column(s) form the unique key in one table, then the latter table is called a *parent table* and its key is called a *parent key*. The other table is called a *child table*, and the relation between the tables is called a *parent-child* relationship. The child table is said to *depend* on the parent table. The common information in the child table is called a *dependent* or *foreign key*. When a parent record is deleted, referential integrity requires the deletion of all child records with a foreign key value which matches the deleted parent key value. This is called a *cascade delete*.

The primary, parent key for the Handler Identification and Program Activity Tracking tables in RCRAInfo is the Handler ID. The highest parent table is the Basic Handler (HBASIC) table. In RCRAInfo, all tables are related to one another using the Handler ID number, which is used in all *subject areas* to tie information together. Another term for subject area is module. An example of a RCRAInfo subject area is Handler Identification. A child table of HBASIC is the Permit Series Table (PSERIES). Handler ID is the parent key in HBASIC and the foreign key in PSERIES.

## 1.6 Other Documents/Files

- *RCRAInfo Data Element Dictionary*
- *RCRAInfo Table Lists*
- *RCRAInfo Entity Relationship Diagrams (ERDs)*
- *RCRAInfo Lookup Table Files*
- *RCRIS to RCRAInfo Data Crosswalks*

The above supplemental information will be posted in PDF format as it becomes available on the Office of Solid Waste Partnership Web Site at <http://www.epa.gov/oswfiles>.

## 2.0 DATA SUBMISSION OVERVIEW

### 2.1 Testing the Translation Effort

It is the responsibility of the state or regional translator to ensure that correctly formatted flat files are produced for inclusion in the RCRAInfo National Implementer Database.

### 2.2 Data Transfer Requirements

Translator flat files must ultimately be transmitted to the Unix server located at EPA's National Computer Center in North Carolina where the RCRAInfo National Implementer Oracle Database resides. Responsibility for this transmittal and for loading the data into the National Implementer database will be agreed upon by the State and the appropriate EPA Regional RCRA personnel. The preferred method for providing data to EPA is electronic file transfer via Internet-based File Transfer Protocol (FTP). For large submissions, file compression is recommended. Other options are mailing floppy diskettes, sending data in an attachment to an EMAIL message, or some other form of electronic data transfer. Submission of data using magnetic tape cannot be supported. State translators who utilize any method other than FTP for file transfer must submit their data to the EPA Regional Database Administrator who will then FTP the data to the EPA Unix server.

Before sending data, the following steps are recommended in order to ensure that the data transfer process proceeds smoothly:

- The transfer medium should be tested after completion of the data extract process to ensure readability and correctness of the data.
- If a physical medium (e.g., diskette) is used, the medium must be completely and accurately labeled. Any instructions required to correctly retrieve that flat files from the medium should also be included. In addition, the data submission should be sent in packaging which will protect it from magnetic and/or static electric disturbance.
- A backup copy of the data files should be retained as a record of the submission, and for use in case the original submission is lost or damaged.

### 2.3 Control Information

The State or Regional translator must produce a Control File (flat file ID = 'CL' as described in Appendix A) to be included with each data submission which summarizes each flat file being submitted. One Control File record is created for each submitted flat file. **All data in the Control File must be in upper case.** The following fields must be included in the Control File:

- Flat file Name (see Appendix A)
- Version of RCRAInfo data entry software currently in production (first digit only)
- Creation date for the flat file
- Number of records in the Flat File
- Module full replacement indicator which indicates whether all records for a subject area (module) are being supplied.

Translator load jobs will be submitted for one state at a time. Ownership of the data being submitted will be derived from information provided via the job submittal data entry process. Translators will not need to provide this information via the flat files.

It is recommended that the translator develop a standard set of audit reports at a greater level of detail than provided in the control file for use in troubleshooting should problems occur during loading of the data into RCRAInfo.

## 2.4 Data Ownership/Security

*Implementer of Record (IOR)* is the term used to describe the agency (State or EPA) responsible for data entry and management of specific RCRAInfo handler identification and program activity data for a given state or territory. Usually, the responsible agency that does the work owns the data that tracks the work and, therefore, is the IOR for that data. A State and EPA are responsible for assigning the IOR for RCRA data during annual RCRA grant negotiations. The annual RCRAInfo data responsibilities become a component of the State/EPA Memorandum of Agreement (MOA) process where applicable, and a Memorandum of Understanding (MOU) for information sharing and data management responsibilities between the State and EPA.

Although all implementer data in RCRAInfo will reside in the same physical database, each implementer will own and control update access to its data. Security functions implemented at both the database- and application levels will prevent unauthorized users from changing data. Please note that all **authorized** RCRAInfo application users will be allowed universal read access to all data in the database, including implementer-defined information and enforcement sensitive information.

There are two types of IOR present in RCRAInfo: *Fixed* and *Variable*. Fixed IOR applies to data tables for which either the state or the region is completely responsible. Variable IOR applies to data tables where ownership may vary between the state and the region depending on specified values in a decision column/field.

IOR for fixed IOR tables is determined by examining the first two characters of the Handler ID for which data is being entered. For example, in the P SERIES table, the first two characters of FK\_HBASICHANDLER\_ID are utilized to determine row ownership. **This means that ALL state ID numbers where used as the primary key must begin with a valid state prefix.**

IOR for variable IOR tables is determined by checking a data column called ACTIVITY\_LOCATION and the decision column for the table. For example, in the PEVENT table ACTIVITY\_LOCATION and RESPONSIBLE\_AGENCY are queried. Allowed values for ACTIVITY\_LOCATION are all state postal codes. Allowed values for RESPONSIBLE\_AGENCY are E, S, or J. A table (called TSRESPONSIBLE\_PARTY) is maintained and queried in RCRAInfo which tracks which agency owns each value for each decision column (in this instance, E, S, and J).

RCRAInfo introduces a new data tracking capability which impacts the way IOR is implemented in the system. Regions and States may enter data into tables where variable IOR applies, and link that data to data in fixed IOR tables associated with Handler ID Numbers owned by other States or Regions. The primary purpose of this change is to resolve the long-standing out-of-state transporter ID number assignment and tracking issue. Regions and States may now enter their own Handler Identification, Permitting, Corrective Action, and Compliance Monitoring & Enforcement data and link it to an out-of-state ID number. Each Region/State co-implementer pair will continue to negotiate which implementer owns fixed IOR data. The difference now is that IOR assignments for co-implementer pairs in other Regions and States will also determine which one will be allowed to link variable IOR data to fixed IOR data for out-of-state ID numbers.

The exception to the rule for fixed IOR tables is the HHANDLER table. HHANDLER is a fixed IOR table where the data column ACTIVITY\_LOCATION will be used to determine which co-implementer within a Region/State pair can create and maintain Handler Identification subject area data for an out-of-state HBASIC Handler ID number.

The *RCRAInfo Translator Flat File Load Utility* software will enforce IOR security settings that are maintained against the RCRAInfo National Implementer Oracle database by each Regional Database Administrator. Data not owned by the implementer submitting the translator files will not be loaded. Ownership will be derived from the User ID of the implementer submitting the translator load, and will be used to match each data row against the database IOR settings. The Flat File Specifications provide the IOR type (variable or fixed) and the IOR decision column, where applicable, for each flat file.

## 2.5 Quality Assurance

In addition to enforcing Implementer of Record (IOR) rules, the *RCRAInfo Translator Flat File Load Utility* software will validate incoming translator data. Refer to **Appendix A – Translator Flat File Specifications** and **Appendix B – Translator Data Assessment Edits** for details.

Eight categories of edit checks will be performed, depending upon the specific column (field) or related columns being edited:

- Control File Checks
- Referential Integrity (Orphan Checks)
- Mandatory/System Required Column Checks
- Table Lookups
- Hard-coded Value Checks
- Cross Reference Checks
- Data Type Checks
- Relational Operator Checks

### 2.5.1 Control File Checks

The first step in the translator data load process will be to perform *pre-load* checks to ensure that the information provided in the control file matches what is contained in the other submitted flat files (See **Appendix A–Flat File Specifications**). For example, if the actual number of records in a particular flat file does not match number of records field contained in the control file, an error flag will be set. Any control file errors that are detected will result in the termination of the translator data load process.

### 2.5.2 Referential Integrity (Orphan Checks)

The *RCRAInfo Translator Flat File Load Utility* will verify that the parent and foreign keys provided via the flat files match up in the database. This is critical to ensuring that no orphans are created in the database (child rows with no parent row). For example, the most basic referential integrity check is that a Handler ID number must exist in the HBASIC table (H0 flat file) in order to create an associated row in another table such as HHANDLER (H1 flat file) or P SERIES (P1 flat file).

### 2.5.3 Nationally Required/System Required Column Checks

A *nationally required* data column is considered necessary for program oversight purposes. A *conditional nationally required* data column is necessary if certain conditions are true. Translators must provide nationally required data as applicable. The responsibility to provide non-nationally required data is negotiated between the Region and the State via the State/EPA Memorandum of Agreement (MOA) process. Information sharing and data management responsibilities between the State and EPA are documented in a Memorandum of Understanding (MOU).

*System required* data columns are necessary for data integrity and for proper system functioning. Like certain nationally required data columns, some system-required data columns are required only if certain conditions occur. Refer to **Appendix A—Flat File Specifications** for detailed information on nationally required and system required data columns.

### 2.5.4 Table Lookup Checks

Where there are codes (valid values) associated with a particular column (field) in the database, a lookup table is most often maintained in RCRAInfo. Examples of lookup tables in RCRAInfo are the County Code Table (LU\_COUNTY) and the Permit Event Code Table (LU\_PERMIT\_EVENT). RCRAInfo data entry software employs pick-lists whereby users highlight and select a valid value from the table. The codes are stored in the database as foreign keys to the lookup table. Translators who provide implementer-defined codes to EPA must ensure that these codes are added to the appropriate RCRAInfo lookup table. Most RCRAInfo lookup tables allow implementer-defined codes to be added and maintained.

#### 2.5.4.1 Code Ownership

The column OWNER found in each RCRAInfo lookup table plays an important role in controlling what codes are displayed on a pick list during the data entry process. The allowed values for OWNER are *HQ*, *US*, *01 - 10*, or a valid postal state prefix. HQ (or EPA Headquarters) codes are codes that are nationally defined and nationally required (formerly called *core*). US (for United States) codes are codes that are nationally defined, but are not nationally required (formerly called *non-core*). Codes 01 - 10 represent the ten EPA Regions, and the postal state prefix codes, of course, represent the States. Codes owned by Regions and States are implementer defined and not nationally required. RCRAInfo users and translators will be allowed to add, update, and delete codes from the database only where the associated code OWNER = HQ or US or the Region/State group of which the user (or translator) is a member.

**Note:** Translators must supply the OWNER for any column which is associated with a lookup table as indicated in **Appendix A - Flat File Specifications**.

#### 2.5.4.2 Active Status

The column ACTIVE\_STATUS found in each RCRAInfo lookup table controls which codes can be added to the database via the RCRAInfo data entry screens. Only codes with an active status = Y will appear on pick lists. Codes with an active status = N can remain in the database as historical codes. Likewise, translators will be allowed to create rows containing inactive codes when the full replacement option is chosen. However, if transaction processing is used, an inactive code will be rejected if the translator attempts to add one. (See *Section 3.6-Flat File Processing Methodology* for discussion of full-replacement and transaction processing options.)

### 2.5.5 Hard-coded Value Checks

In the few instances where lookup tables are not used, the RCRAInfo Translator Data Assessment software will be hardcoded with the valid values for a particular column (field) being validated. In all cases, this type of check is used when there are only a few values to be checked. One example is the Responsible Agency (RESPONSIBLE\_AGENCY) column in the Permitting Event (PEVENT) table. Responsible Agency must be equal to **E**, **S**, or **J**. A second example is the Transaction Code (TRANS\_CODE) which translators must include in each flat file in order to enable transaction processing. Valid values for TRANS\_CODE are **C** or **D** to indicate transaction type or **blank** if the Full Replacement Indicator (FULL\_REPLACE\_IND) in the translator Control File is equal to **Y** for the flat files in the module.

### 2.5.6 Cross Reference Checks

The last example provided in the previous section also illustrates the fact that multiple related columns (fields) often must be validated together because there are dependencies between them. A common type of cross reference check is where a particular column cannot be blank if there is a value in another related column. An example of this is that for a row in the Owner/Operator (HOWNER\_OPERATOR) Table, Previous Owner/Operator Date (OWNER\_OPERATOR\_CHANGE\_DATE) is required if the Owner/Operator Indicator (OWNER\_OPERATOR\_INDICATOR) = **PO** (previous owner) or **PP** (previous operator). Referential integrity checks and certain conditional nationally required checks are also examples of cross reference checks.

### 2.5.7 Data Type Checks

For RCRAInfo data, a data type check is used only for columns defined as numeric. Examples are CAPACITY and NUMBER\_OF\_UNITS in the Permitting Unit Detail (PUNIT\_DETAIL) table. Only numeric digits are allowed in these columns. Numeric columns are defined as integer, decimal or date format.

### 2.5.8 Relational Operator Checks

The term relational operator check is being used here to refer to numeric columns which must be greater than, less than, or between a range of a specified value(s). Examples are schedule date and actual date for a Permitting event. Schedule dates (SCHEDULE\_DATE\_ORIG and SCHEDULE\_DATE\_NEW) must be a valid date greater than 5/18/1980. ACTUAL\_DATE cannot be greater than the current date.

## 2.6 Flat File Processing Methodology

Because the RCRA program is co-implemented (i.e., data from both the Region and the State may be provided for a particular Handler ID), RCRAInfo supports transaction processing for translator flat files. Implementer of Record rules are enforced to ensure that the translator does not change or delete data owned by the co-implementer. Transactions will be processed in sequential order as they are read from the flat file. This means that if a transaction to delete data occurs, the data may be added back with a subsequent change transaction (if enough data is provided so as not to generate an error(s)).

A Full Replacement option by subject area (module) is also available. **Please note that the Full Replace option will *only* be allowed if the translator owns all of the data in the module and FULL\_REPLACE\_IND in the Control File records for the flat files for the module is set to Y.** A field called Transaction Code (TRANS\_CODE) is used for all flat files except the Control File. The allowed values for TRANS\_CODE are:

<b>C</b>	Change (Add or Update)
<b>D</b>	Delete
<b>Blank</b>	Full Replace

For *Change* transactions, data will be added if parent key values do not currently exist in the database, and will be modified if parent key values exist in the database. Full replacements for the row being changed must be provided.

For *Delete* transactions, parent key values must currently exist in the database, and only child rows owned by the translator can be present. Only the transaction code and the key fields necessary to identify the parent row to be deleted need to be provided. In addition, a check will be performed as appropriate prior to deletion of a row to ensure that no data owned by another implementer is linked to that row or any other row in related tables impacted by a *cascade delete*.

## 2.7 Handler Identification Subject Area

The objective of the Handler Identification Subject Area is to maintain an inventory of hazardous waste handlers to support RCRA program activity tracking and public data access requests. Hazardous waste handlers are required to notify EPA of their existence by submitting identifying information on the Federal Notification of Regulated Waste Activity Form (EPA form 8700-12) or a State equivalent form. This form provides the States and EPA with basic handler identification data concerning what and where (name, address, owner), specific hazardous waste activities, and wastes handled. EPA or State inspections provide confirmation or updates to information submitted by regulated entities, or may identify entities (called non-notifiers) who are actively generating, transporting, treating, storing, or disposing of hazardous waste, but have not notified EPA.

In RCRAInfo, the parent table for all handler identification and program activity tracking data is the HBASIC table. This provides the entry point for adding new handlers into the system. A row for a handler must exist in the HBASIC table before data in any other table may be added or updated. Each handler must be assigned a unique *Handler Identification Number* which serves as the primary key for the entire system, and a *Handler Name* must be provided. It is also mandatory to indicate via the *Extract Flag* whether nationally required and non-enforcement sensitive data may be extracted for this handler for public access purposes. A place-holder for the EPA Facility Registry System (FRS) *Facility Identifier* is maintained here. The HBASIC table contains one row per ID number, and, therefore, one *owner* per row. A one-to-many relationship between the HBASIC and HHANDLER tables supports *Out-of-State Transporter* tracking. Implementers may use the actual ID number for entering data for out-of-state transporters instead of assigning a different one with their own state code prefix. HHANDLER may contain multiple rows per ID number, each owned by a different implementer (and having a different activity location).

Additional handler identification data is stored in the HHANDLER table. *Location-* and *Mailing Address* information is included. However, *Street Number* may be optionally parsed from *Street* for both address types to facilitate searching and sorting. Handler-level indicators such as *Type of Land*, *Non-Notifier*, *Facility Existence Date*, and *Handler Accessibility* are stored in this table. Unlike the HBASIC table, the

HHANDLER table may contain more than one row for a single Handler ID number. The *Latitude* and *Longitude* coordinates for a facility are stored in the HLATITUDE\_LONGITUDE table. Only a single set of coordinates may be provided. Implementers may optionally provide Environmental Priority Ranking history for a handler. The *EPR Status* for a particular date is contained in the HENV\_PRIORITY\_RANK table.

**Note:** Street Number length for location and mailing address is currently 6 characters in the translator flat file specifications, but has been lengthened in the RCRAInfo database to 12 characters. Translator software and documentation will be corrected in the next structural revision of the guide.

RCRAInfo introduces the capability to track handler name history. Previous handler names and associated dates are contained in the HPREVIOUS\_NAME table. Names, addresses, and phone numbers for Handler Contacts for various contact types (such as for Notification and Part A forms) are contained in the HCONTACT table. The HOWNER\_OPERATOR table stores information about owners and operators for a handler such as name, type, address, and phone number. Multiple owner and operator rows may be supplied and a history of previous owners and operators may also be maintained. For previous owners and operators, a date changed must be provided.

Standard Industrial Classification (SIC) codes for a facility are tracked in the HSIC table. One and only one SIC code must be designated as primary. The HOTHER\_PERMIT table stores information on other environmental permits provided by the facility on the federal Part A permit application form. This data is optional.

**Note:** The capability to track NAICS codes will not be added to RCRAInfo until the first structural revision if, at that time, policies and procedures have been promulgated by the agency.

In RCRAInfo, implementers have the option to track multiple views of handler activities and waste stream data. A SOURCE\_TYPE of **N** indicates that the information was reported by the handler on the federal Notification form or state equivalent. A SOURCE\_TYPE of **A** indicates that the information was reported by a facility on the federal Part A permit application form or state equivalent. A SOURCE\_TYPE of **E** indicates EPA inspection; a SOURCE\_TYPE of **S** indicates State inspection. If only one view is tracked, a SOURCE\_TYPE of **N** is used.

For each SOURCE\_TYPE, at indication of at least one handler activity (such as Generator or Transporter) must be provided unless the handler is a non-notifier. The HACTIVITY table tracks information on handler activity and federal and state regulatory status. Waste code data which is collected on the federal Notification and Part A forms is optional. The HHAZARDOUS\_WASTE\_STREAM, HHAZARDOUS\_WASTE\_CODE, and HHAZARDOUS\_WASTE\_PROCESS tables contain this information.

## 2.7.1 Handler Identification Subject Area Entity Relationships

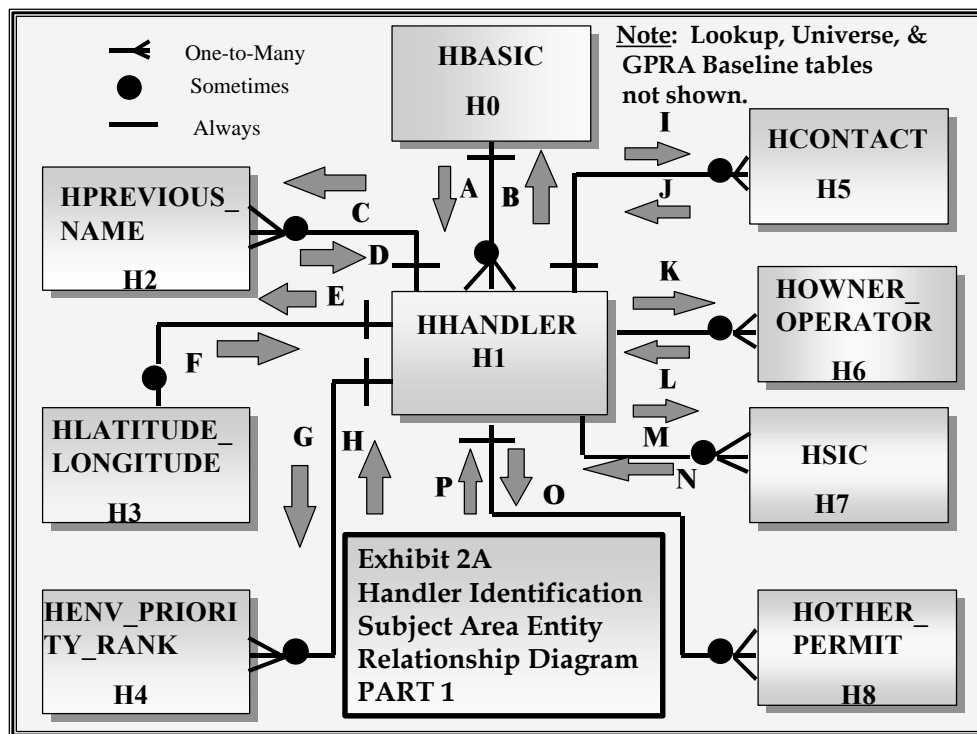

Exhibit 2A provides a graphical depiction of the first nine tables in the Handler Identification Subject Area, and the relationships between them. Refer to the legend below for a description of each relationship. Each table is directly related to a corresponding flat file. The “crows feet” indicate a one-to-many relationship between rows in two linked tables. The bars indicate mandatory relationships (i.e., linkages are required in all cases). The circles indicate optional relationships (i.e., linkages are not required). Lookup tables and Universe tables (which contain data calculated by the RCRAInfo system), and the GPRA Baseline table are not shown because translators will not provide them as flat files.

- A. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** Handler (HHANDLER) rows.
- B. Each Handler (HHANDLER) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- C. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Previous Name (HPREVIOUS\_NAME) rows.
- D. Each Previous Name (HPREVIOUS\_NAME) **must always** be linked to **one** Handler (HHANDLER) row.
- E. Each Handler (HHANDLER) row **may or may not** be linked to **one** Lat/Long (HLATITUDE\_LONGITUDE) row.
- F. Each Latitude/Longitude (HLATITUDE\_LONGITUDE) row **must always** be linked to **one** Handler (HHANDLER) row.

- G. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Environmental Priority Ranking (HEP\_RANKING) rows.
- H. Each Environmental Priority Ranking (HENV\_PRIORITY\_RANK) row **must always** be linked to **one** Handler (HHANDLER) row.
- I. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Contact (HCONTACT) rows.
- J. Each Contact (HCONTACT) row **must always** be linked to **one** Handler (HHANDLER) row.
- K. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Owner/Operator (HOWNER\_OPERATOR) rows.
- L. Each Owner/Operator (HOWNER\_OPERATOR) row **must always** be linked to **one** Handler (HHANDLER) row.
- M. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Standard Industrial Classification Code (HSIC) rows.
- N. Each Standard Industrial Classification Code (HSIC) row **must always** be linked to **one** Handler (HHANDLER) row.
- O. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Other Permits (HOTHER\_PERMIT) rows.
- P. Each Other Permit (HOTHER\_PERMIT) row **must always** be linked to **one** Handler (HHANDLER) row.

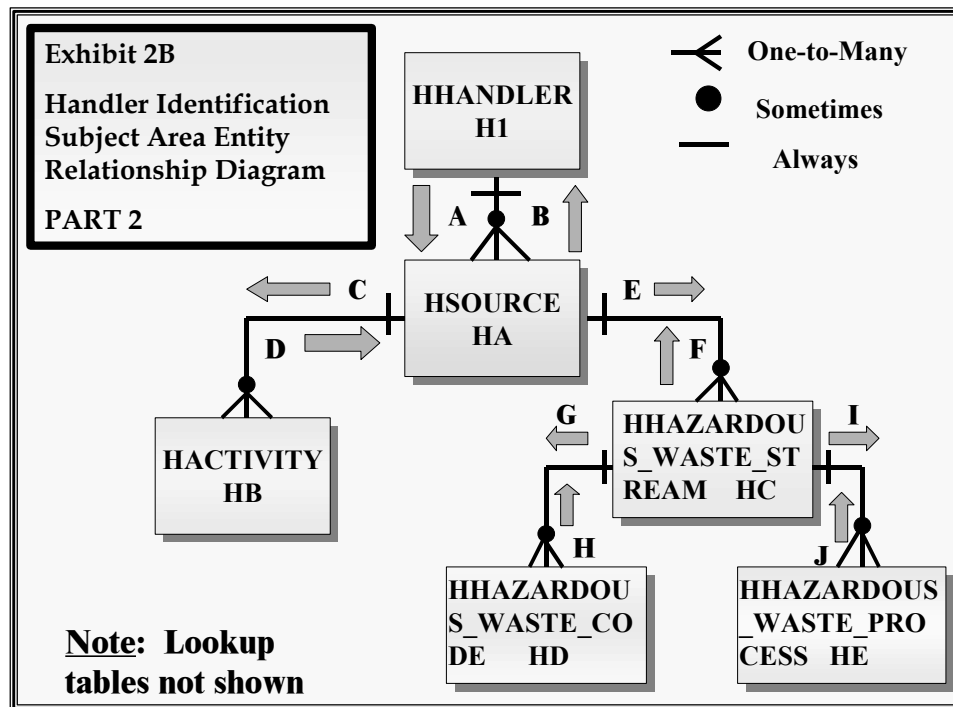

Exhibit 2B provides a graphical depiction of the remaining tables in the Handler Identification Subject Area, and the relationships between them. Refer to the legend below for a description of each relationship. Each table is directly related to a corresponding flat file. The “crows feet” indicate a one-to-many relationship between rows in two linked tables. The bars indicate mandatory relationships (i.e., linkages are required in all cases). The circles indicate optional relationships (i.e., linkages are not required). Lookup tables are not shown because translators will not provide them as flat files.

- A. Each Handler (HHANDLER) row **may or may not** be linked to **one or more** Source (HSOURCE) rows.
- B. Each Info. Source (HSOURCE) row **must always** be linked to **one** Handler (HHANDLER) row.
- C. Each Info. Source (HSOURCE) row **may or may not** be linked to **one or more** Handler Activity (HACTIVITY) rows.
- D. Each Activity (HACTIVITY) row **must always** be linked to **one** Info. Source (HSOURCE) row.
- E. Each Info. Source (HSOURCE) row **may or may not** be linked to **one or more** Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) rows.
- F. Each Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) **must always** be linked to **one** Info. Source (HSOURCE) row.

- G. Each Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) row **may or may not** be linked to **one or more** Hazardous Waste Code (HHAZARDOUS\_WASTE\_CODE) rows.
- H. Each Hazardous Waste Code (HHAZARDOUS\_WASTE\_CODE) row **must always** be linked to **one** Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) row.
- I. Each Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) row **may or may not** be linked to **one or more** Hazardous Waste Associated Process (HHAZARDOUS\_WASTE\_PROCESS) rows.
- J. Each Hazardous Waste Associated Process (HHAZARDOUS\_WASTE\_PROCESS) row **must always** be linked to **one** Hazardous Waste Stream (HHAZARDOUS\_WASTE\_STREAM) row.

## 2.7.2 Handler Identification Transaction Processing

A transaction code (TRANS\_CODE) must be present in each flat file for each record to indicate whether the modification is an *Add/Update* (TRANS\_CODE = **C**) or a *Delete* (TRANS\_CODE = **D**), **and** the Full Replacement Indicator (FULL\_REPLACE\_IND) in the Control File for all submitted flat files associated with the module must = **Blank**.

### 2.7.2.1 H0 (HBASIC) Flat File

HBASIC data is part of the fixed IOR HHANDLER (H1) block; either the State or Region owns all of the data in this table for a given state or territory (activity location). Only one HBASIC row may exist in the database for a given Handler Identification Number. The translator must be IOR for HHANDLER data for a given ACTIVITY\_LOCATION to effect any changes to the table.

#### 2.7.2.1.1 Add/Update

To add or update a Handler Basic table row, TRANS\_CODE must = **C**.

- To update a HBASIC table row, a replacement for the entire row must be provided. Column-specific updates are not supported. If a row owned by the translator exists in HBASIC which matches the key column HANDLER\_ID provided in the H0 flat file, the row will be updated.

**Note:** A Handler Identification Number cannot be changed using a *Change* transaction because it is the primary key for the system. To change a handler identification number, all rows in the database for the handler must first be deleted and then recreated (added) using the revised key.

- If a HBASIC table row which matches the key field HANDLER\_ID provided in the H0 flat file does **not** exist **and** if the translator is authorized, a new HBASIC table row will be created.

**Note:** A HBASIC row should be linked to one or more HHANDLER table rows even though the database structure doesn't enforce it. When adding a new handler to the database, translators should also include corresponding handler identification data in the H1 (HHANDLER) flat file.

**Note:** Implementers may use non-standard Handler ID numbers as the primary key. However, the first two characters of the non-standard ID number must be a valid state code. If a non-standard Handler ID number is added to HBASIC, the Secondary ID Number field in HHANDLER (H1) must be populated with the same ID number. The translator load data assessment software will apply the EPA ID number check digit algorithm to all HANDLER\_IDs added to HBASIC. If the ID number provided in H0 fails the check digit algorithm, a WARNING message will be displayed and the handler will be added to the database. When the H1 (HHANDLER) flat file is subsequently processed, the data assessment software will check to see if a secondary ID number (SECOND\_ID) is provided which matches the non-standard ID number added to the HBASIC table earlier in the process. If not, the H1 record will be rejected.

#### 2.7.2.1.2 Delete

**Caution must be exercised with this transaction. Deleting a row from the HBASIC table removes the HBASIC table row PLUS all rows in other tables associated with the specified Handler Identification Number.** In order to delete a handler from the database, the H0 flat file must contain a record where TRANS\_CODE = **D** and the key field HANDLER\_ID is provided. A matching row owned by the translator must exist in the database.

Rows in other flat files representing the delete Handler transaction must **not** be present. Deleting a Handler will automatically *cascade delete* all rows in other related RCRAInfo Handler Identification and Program Activity Tracking tables. Related delete transactions in other flat files will generate error messages because the data will have been previously deleted via the H0 flat file "Delete Handler" transaction.

**Note: If any entries exist in any other tables for a given Handler ID which have an owner other than the owner specified in the translator control file, the transaction will not be processed. Before deletion of the handler can proceed, the co-implementer and/or other implementers must delete all related data (i.e., any rows linked to the specified Handler Identification Number) from the RCRAInfo National Implementer database.**

#### 2.7.2.2 H1 (HHANDLER) Flat File

HHANDLER data is fixed IOR within the context of a Region/State co-implementer pair; either the State or the Region owns all of the data in this table for a given state or territory. Only one HHANDLER row per Handler ID may exist for a particular Region/State co-implementer pair (i.e., ACTIVITY\_LOCATION); however multiple HHANDLER rows may exist which are owned by other States or Regions in order to support tracking of out-of-state transporters. In either case, the translator must be IOR for HHANDLER data for the specified ACTIVITY\_LOCATION to effect any changes to the table.

#### 2.7.2.2.1 Add/Update

To add or update a Handler Identification data table row, TRANS\_CODE must = **C**.

- To update a HHANDLER table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a row owned by the translator exists in HHANDLER which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION provided in the H1 flat file, the row will be updated.

#### 2.7.2.2.1 Add/Update (continued)

- If a HHANDLER table row which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION provided in the H1 flat file does **not** exist **and** if the translator is authorized, a new HHANDLER table row will be created.

**Note:** A HHANDLER row must be linked to a matching HBASIC row. When adding a new Handler Identification data row, the translator must first create the associated HBASIC (H0) row if that translator is the owner of HBASIC for a given state or territory. Regardless, if there is no matching HBASIC row in the database, a referential integrity violation will occur.

#### 2.7.2.2.2 Delete

**If the translator owns HBASIC data for a given state or territory, a delete transaction for HHANDLER data will not be allowed because a referential integrity violation would occur.** The translator must instead use a delete transaction in the HBASIC (H0) flat file to remove a handler from the database.

However, translators who do not own the associated HBASIC row and have created Handler Identification data to track an out-of-state transporter **may** delete HHANDLER data. In order to delete a Handler Identification data row, the H1 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID and ACTIVITY\_LOCATION are present. Rows in other related flat files representing the delete transaction must **not** be present. Deleting Handler Identification data for a Handler ID will automatically *cascade delete* all associated rows owned by the translator in the other Handler Identification subject area tables (flat files H2 - HE). Related delete transactions in the H2 - HE flat files will generate error messages because the data will have been previously deleted via the H1 flat file "Delete Handler Identification Data" transaction.

#### 2.7.2.3 H2 (HPREVIOUS\_NAME) Flat File

Handler Previous Name data is fixed IOR within the context of a Region/State co-implementer pair; either the State or Region owns all of the data in this table for a given state or territory (i.e., ACTIVITY\_LOCATION). Each Handler ID for a given ACTIVITY\_LOCATION may be associated with multiple previous names. The translator must be IOR for HHANDLER data to effect any changes to the HPREVIOUS\_NAME table.

#### 2.7.2.3.1 Add/Update

To add or update a Handler Previous Name table row, TRANS\_CODE must = **C**.

#### 2.7.2.3.1 Add/Update (continued)

- To update a HPREVIOUS\_NAME table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HPREVIOUS\_NAME table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** RECEIVE\_DATE provided in the H2 flat file, the HPREVIOUS\_NAME row will be updated.
- If a HPREVIOUS\_NAME table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** RECEIVE\_DATE provided in the H2 flat file does **not** exist, **and** if the translator is authorized, a new HPREVIOUS\_NAME row will be created.

**Note:** The date received (RECEIVE\_DATE) for a name change cannot be updated via a change transaction because it is a key column. To update an erroneous receipt date, the row must first be deleted and then recreated with the revised key.

#### 2.7.2.3.2 Delete

To delete a Previous Name row, the H2 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and RECEIVE\_DATE are provided. A matching row owned by the translator must exist in the HPREVIOUS\_NAME table.

#### 2.7.2.4 H3 (HLATITUDE\_LONGITUDE) Flat File

Locational data is fixed IOR within the context of a Region/State co-implementer pair; either the State or Region owns all of the data in this table for a given state or territory. One locational coordinate row per Handler may be supplied for a particular Region/State co-implementer pair (i.e., ACTIVITY\_LOCATION). The translator must be IOR for HHANDLER data to effect any changes to the HLATITUDE\_LONGITUDE table.

#### 2.7.2.4.1 Add/Update

To add or update a Latitude/Longitude table row, TRANS\_CODE must = **C**.

- To update a HLATITUDE\_LONGITUDE table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HLATITUDE\_LONGITUDE table row owned by the translator exists which matches the key fields HANDLER\_ID and ACTIVITY\_LOCATION provided in the H3 flat file, the row will be updated.
- If a HLATITUDE\_LONGITUDE table row owned by the translator which matches the key fields HANDLER\_ID and ACTIVITY\_LOCATION provided in the H3 flat file does **not** exist **and** the translator is authorized, a new HLATITUDE\_LONGITUDE row will be created.

#### 2.7.2.4.2 Delete

To delete a locational coordinate row, the H3 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID and ACTIVITY\_LOCATION are provided. A matching row owned by the translator must exist in the HLATITUDE\_LONGITUDE table.

#### 2.7.2.5 H4 (HENV\_PRIORITY\_RANK) Flat File

Environmental Priority Ranking data is fixed IOR within the context of a Region/State co-implementer pair (i.e., ACTIVITY\_LOCATION); either the State or Region owns all of the data in this table for a given state or territory. Multiple Environmental Priority rankings per IOR owner may be supplied. The translator must be IOR for HHANDLER data to effect any changes to the table.

##### 2.7.2.5.1 Add/Update

To add or update an Environmental Priority Ranking table row, TRANS\_CODE must = **C**.

- To update a HENV\_PRIORITY\_RANK table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HENV\_PRIORITY\_RANK table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** EPR\_DATE provided in the H4 flat file, the row will be updated.
- If an HENV\_PRIORITY\_RANK table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** EPR\_DATE provided in the H4 flat file does **not** exist **and** the translator is authorized, a new HEP\_RANKING row will be created.

**Note:** The EPR Date (EPR\_DATE) for an EP Ranking cannot be updated via a change transaction because it is a key column. To update an erroneous EPR date, the row must first be deleted and then recreated with the revised key.

##### 2.7.2.5.2 Delete

To delete an Environmental Priority Rank table row, the H4 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and EPR\_DATE are provided. A matching row owned by the translator must exist in the HENV\_PRIORITY\_RANK table in order to be deleted from the system.

#### 2.7.2.6 H5 (HCONTACT) Flat File

HCONTACT data is variable IOR; the decision field is CONTACT\_TYPE. The translator must be IOR for the specified contact type for the given ACTIVITY\_LOCATION in order to create or update contact data.

##### 2.7.2.6.1 Add/Update

To add or update a Handler Contact table row, TRANS\_CODE must = **C**.

- To update a HCONTACT table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HCONTACT table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** OWNER (for Contact Type Code) **plus** CONTACT\_TYPE provided in the H5 flat file, the HCONTACT row will be updated.
- If a HCONTACT table row owned by the translator which matches the key fields HANDLER\_ID **plus** OWNER (for Contact Type Code) **plus** ACTIVITY\_LOCATION **plus** CONTACT\_TYPE provided in the H5 flat file does **not** exist, a new HCONTACT row will be created.

#### 2.7.2.6.2 Delete

To delete a Handler Contact table row, the H5 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, OWNER (for Contact Type Code), and CONTACT\_TYPE are provided. A matching row owned by the translator must exist in the HCONTACT table.

#### 2.7.2.7 H6 (HOWNER\_OPERATOR) Flat File

Handler Owner/Operator data is fixed IOR within the context of a Region/State co-implementer pair (i.e., ACTIVITY\_LOCATION); either the State or Region owns all of the data in this table for a given state or territory. Each Handler ID may be associated with multiple current and previous owner and operator names. The translator must be IOR for HOWNER\_OPERATOR data to effect any changes to the table.

##### 2.7.2.7.1 Add/Update

To add or update a Owner or Operator table row, TRANS\_CODE must = **C**.

- To update a HOWNER\_OPERATOR table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HOWNER\_OPERATOR table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** OWNER\_OPERATOR\_SEQUENCE provided in the H6 flat file, the HOWNER\_OPERATOR row will be updated.
- If a HOWNER\_OPERATOR table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** OWNER\_OPERATOR\_SEQUENCE provided in the H6 flat file does **not** exist, a new HOWNER\_OPERATOR row will be created.

**Note:** The Owner/Operator Indicator (OWNER\_OPERATOR\_INDICATOR), which is used to determine whether the row represents a current owner, previous owner, current operator, or previous operator, is NOT a key column. OWNER\_OPERATOR\_SEQUENCE, therefore, does not repeat by OWNER\_OPERATOR\_INDICATOR as may be expected. It must be unique for the HHANDLER row it is linked to.

#### 2.7.2.7.2 Delete

To delete an Owner/Operator row, the H6 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and OWNER\_OPERATOR\_SEQUENCE are provided. A matching row owned by the translator must exist in the HOWNER\_OPERATOR table.

#### 2.7.2.8 H7 (HSIC) Flat File

Handler SIC Code data is fixed IOR within the context of a Region/State co-implementer pair; either the State or Region owns all of the data in this table for a given state or territory (i.e., ACTIVITY\_LOCATION). Each Handler ID may be associated with multiple SIC Codes. The translator must be IOR for HSIC data to effect any changes to the table.

##### 2.7.2.8.1 Add/Update

To add or update a SIC Code table row, TRANS\_CODE must = **C**.

- To update a HSIC table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HSIC table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SIC\_SEQUENCE provided in the H7 flat file, the HSIC row will be updated.
- If a HSIC table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SIC\_SEQUENCE provided in the H7 flat file does **not** exist **and** if the translator is authorized, a new HSIC row will be created.

##### 2.7.2.8.2 Delete

To delete a SIC Code row, the H7 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and SIC\_SEQUENCE are provided. A matching row owned by the translator must exist in the HSIC table.

#### 2.7.2.9 H8 (HOTHER\_PERMIT) Flat File

Environmental Permit data is fixed IOR within the context of a Region/State co-implementer pair; either the State or Region owns all of the data in this table for a given state or territory. Each Handler ID may be associated with multiple Other Permit Numbers for a given ACTIVITY\_LOCATION. The translator must be IOR for HOTHER\_PERMIT data to effect any changes to the table.

##### 2.7.2.9.1 Add/Update

To add or update a Handler Other Environmental Permits table row, TRANS\_CODE must = **C**.

- To update a HOTHER\_PERMIT table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HOTHER\_PERMIT table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** OTHER\_PERMIT\_NUMBER provided in the H8 flat file, the HOTHER\_PERMIT row will be updated.

- If a HOTHER\_PERMIT table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** OTHER\_PERMIT\_NUMBER provided in the H8 flat file does **not** exist **and** if the translator is authorized, a new HOTHER\_PERMIT row will be created.

#### 2.7.2.9.2 Delete

To delete an Other Environmental Permits table row, the H8 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and OTHER\_PERMIT\_NUMBER are provided. A matching row owned by the translator must exist in the database.

#### 2.7.2.10 HA (HSOURCE) Flat File

HSOURCE data is variable IOR; the decision field is SOURCE\_TYPE. Each HHANDLER row for an ACTIVITY\_LOCATION may have one HSOURCE row for each SOURCE\_TYPE. The translator must be IOR for the specified source type for the given ACTIVITY\_LOCATION in order to create or update handler information source data.

##### 2.7.2.10.1 Add/Update

To add or update a Handler Information Source table row, TRANS\_CODE must = **C**.

- To update a HSOURCE table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HSOURCE table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE provided in the HA flat file, the HSOURCE row will be updated.
- If a HSOURCE table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE provided in the HA flat file does **not** exist **and** the translator is authorized, a new HSOURCE row will be created.

##### 2.7.2.10.2 Delete

To delete a Handler Information Source table row, the HA flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, and SOURCE\_TYPE are provided. A matching row owned by the translator must exist in the HSOURCE table. Rows in other related flat files representing the delete Handler Information Source transaction must **NOT** be present. Deleting a Source row for a Handler ID will automatically *cascade delete* all associated rows in the Activity, and Waste Stream tables. Related delete transactions in the HB - HE flat files will generate error messages because the data will have been previously deleted.

#### 2.7.2.11 HB (HACTIVITY) Flat File

Handler activity data is variable IOR; the decision field is SOURCE\_TYPE in the HSOURCE table. Each HSOURCE row may have one or more HACTIVITY rows associated with it. The translator must be IOR for the specified SOURCE\_TYPE for the given ACTIVITY\_LOCATION in order to update HACTIVITY data.

#### 2.7.2.11.1 Add/Update

- To update a HACTIVITY table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HACTIVITY table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** ACTIVITY\_SEQ provided in the HB flat file, the HACTIVITY row will be updated.
- If a HACTIVITY table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** ACTIVITY\_SEQ provided in the HB flat file does **not** exist **and** if the translator is authorized, a new HACTIVITY row will be created.

#### 2.7.2.11.2 Delete

To delete a Handler Activity row, the HC flat file must contain a record where TRANS\_CODE = **D**, and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, SOURCE\_TYPE, and ACTIVITY\_SEQ must exist in the HACTIVITY table.

#### 2.7.2.12 HC (HHAZARDOUS\_WASTE\_STREAM) Flat File

Hazardous Waste Stream data is variable IOR; the decision field is SOURCE\_TYPE in the HSOURCE table. Each HSOURCE row may have multiple HHAZARDOUS\_WASTE\_STREAM rows associated with it. The translator must be IOR for the specified SOURCE\_TYPE for the given ACTIVITY\_LOCATION in order to update HHAZARDOUS\_WASTE\_STREAM data.

#### 2.7.2.12.1 Add/Update

- To update a HHAZARDOUS\_WASTE\_STREAM table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. If a HHAZARDOUS\_WASTE\_STREAM table row owned by the translator exists which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** WASTE\_STREAM\_SEQUENCE provided in the HC flat file, the HHAZARDOUS\_WASTE\_STREAM row will be updated.

#### 2.7.2.12.1 Add/Update (continued)

- If a HHAZARDOUS\_WASTE\_STREAM table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** WASTE\_STREAM\_SEQUENCE provided in the HC flat file does **not** exist **and** the translator is authorized, a new HHAZARDOUS\_WASTE\_STREAM row will be created.

**Note:** A HHAZARDOUS\_WASTE\_STREAM row should be linked to one or more HHAZARDOUS\_WASTE\_CODE table rows. When adding a new hazardous waste stream to the database, translators should also include corresponding waste codes in the HD (HHAZARDOUS\_WASTE\_CODE) flat file.

#### 2.7.2.12.2 Delete

To delete a handler waste stream table row, the HC flat file must contain a record where TRANS\_CODE = **D**, and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, SOURCE\_TYPE, and WASTE\_STREAM\_SEQUENCE are provided. A matching row owned by the translator must exist in

the HHAZARDOUS\_WASTE\_STREAM table. Rows in other related flat files representing the Delete Waste Stream transaction must **NOT** be included. Deleting a Waste Stream row for a Handler ID and Information Source will automatically *cascade delete* all associated rows in the Hazardous Waste Code and Hazardous Waste Process tables. Related delete transactions in the HD and HE flat files will generate error messages because the data will have been previously deleted.

#### 2.7.2.13 HD (HHAZARDOUS\_WASTE\_CODE) Flat File

Hazardous Waste Code data is variable IOR; the decision field is SOURCE\_TYPE in the HSOURCE table. Each HSOURCE row may have multiple HHAZARDOUS\_WASTE\_STREAM rows associated with it. Each HHAZARDOUS\_WASTE\_STREAM row should have one or more HHAZARDOUS\_WASTE\_CODE rows associated with it. The translator must be IOR for the specified SOURCE\_TYPE for the given HHANDLER row ACTIVITY\_LOCATION in order to update HHAZARDOUS\_WASTE\_CODE data.

##### 2.7.2.13.1 Add

To add a hazardous waste code table row, TRANS\_CODE must = **C**.

- If a HHAZARDOUS\_WASTE\_CODE table row owned by the translator which matches the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** WASTE\_STREAM\_SEQUENCE **plus** OWNER (of Waste Code) **plus** WASTE\_CODE provided in the HD flat file does **not** exist **and** the translator is authorized, a new HHAZARDOUS\_WASTE\_CODE row will be created.

**Note: A Waste Code (WASTE\_CODE) associated with a Waste Stream cannot be updated via a change transaction because it is a key column. To update an erroneous waste code, the row must be deleted and recreated with the revised key.**

##### 2.7.2.13.2 Delete

- To delete a hazardous waste code table row, the HD flat file must contain a record where TRANS\_CODE = **D**, and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, SOURCE\_TYPE, WASTE\_STREAM\_SEQUENCE, OWNER (of Waste Code), and WASTE\_CODE are provided. A matching row owned by the translator must exist in the HHAZARDOUS\_WASTE\_CODE table.

#### 2.7.2.14 HE (HHAZARDOUS\_WASTE\_PROCESS) Flat File

Hazardous Waste Associated Process data is variable IOR; the decision field is SOURCE\_TYPE in the HSOURCE table. Each HSOURCE row may have multiple HHAZARDOUS\_WASTE\_STREAM rows associated with it. Each HHAZARDOUS\_WASTE\_STREAM row may have one or more HHAZARDOUS\_WASTE\_PROCESS rows associated with it. The translator must be IOR for the specified SOURCE\_TYPE for a given ACTIVITY\_LOCATION in order to update HHAZARDOUS\_WASTE\_PROCESS data.

#### 2.7.2.14.1 Add

To add a hazardous waste associated process code table row, TRANS\_CODE must = **C**.

- If a HHAZARDOUS\_WASTE\_CODE table row owned by the translator which matches the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** SOURCE\_TYPE **plus** WASTE\_STREAM\_SEQUENCE **plus** OWNER (of Process Code) **plus** PROCESS\_CODE provided in the HE flat file does **not** exist **and** the translator is authorized, a new HHAZARDOUS\_WASTE\_PROCESS row will be created.

**Note: A Waste Associated Process (HHAZARDOUS\_WASTE\_PROCESS) table row for a particular Waste Stream cannot be updated via a change transaction because it is a key column. To update an erroneous process code, the row must be deleted and recreated with the revised key.**

#### 2.7.2.14.2 Delete

To delete a hazardous waste code table row, the HE flat file must contain a record where TRANS\_CODE = **D**, and the key fields HANDLER\_ID, ACTIVITY\_LOCATION, SOURCE\_TYPE, WASTE\_STREAM\_SEQUENCE, OWNER (of Process Code), and PROCESS\_CODE are provided. A matching row owned by the translator must exist in the HHAZARDOUS\_WASTE\_PROCESS table.

## 2.8 Permitting/Closure/Post-Closure Subject Area

A *Permitting Series* is the collection of data associated with the processing of a permit application, closure plan, permit modification, or other similar action by RCRA Permitting/Closure/Post-Closure program staff. A Treatment, Storage & Disposal Facility (TSDF) may have one or many permit applications, closure plans, etc., each of which may reference many hazardous waste process units and permitting milestone events. A Permitting Series describes a set of process unit groups at a facility, as well as the events which occur over time associated with each process unit group. A facility may request a unique application process to cover any particular unit or group of units. Under RCRA, a facility may have units which concurrently are going through closure, which have an operating permit, and which are subject to permit modification.

In RCRAInfo, each Permitting Series is assigned a *Sequence Number* and a *Series Name* which is stored in the PSERIES table. The option to supply initials for EPA and State personnel responsible for a particular Permitting Series (*EPA Person*, *State Person*, *EPA Attorney*, *State Attorney*), and *Notes* (comments) relating to the series is also available.

Each Permitting Series may be associated with many *Permitting Event* milestones. Permitting event milestone data is stored in the PEVENT table. Because a particular event can occur more than once over time, a *Sequence Number* (which increments by *Responsible Agency*) is used as part of the key to differentiate between them. *Scheduled*, *Revised*, and *Actual Completion Dates* for the event are maintained here. The option to provide initials for the *Responsible Person* and *Notes* about the event is available as well.

A Permitting Series may be associated with one or more *Process Unit Groups*. Process Unit Group data is stored in the PUNIT and PUNIT\_DETAIL tables. A *Sequence Number* is used as a key field to differentiate unit groups from one another. Implementers are encouraged to enter process unit group

names directly from the Part A/Part B Permit Application as supplied by the facility or make up their own to specifically describe the process unit group. A history of *Legal and Operating Statuses* for each unit group is maintained which, in conjunction with Permitting event milestone data in the PEVENT table, enables program implementers and overseers to monitor permit status. *Notes* may be optionally entered at both the unit and unit detail levels. Finally, a *linking table* which supplies the key values to link event data to unit data and conversely, unit data to event data (PLN\_EVENT\_UNIT) is maintained.

### 2.8.1 Permitting/Closure/Post-closure Subject Area Entity Relationships

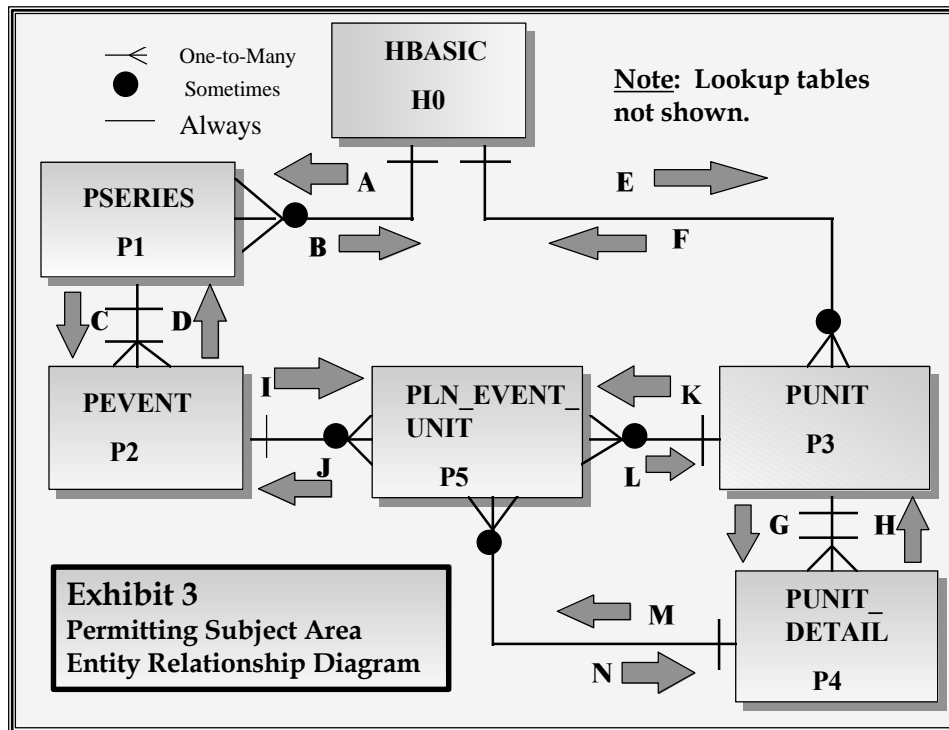

Exhibit 3 provides a graphical depiction of the entities (tables) in the Permitting subject area, and the relationships between them. Refer to the legend below for description of each relationship. Each table is directly related to a corresponding flat file. The “crows feet” indicate a one-to-many relationship between rows in two linked tables. The vertical bars indicate mandatory relationships (i.e., linkages are required). The circles indicate optional relationships (i.e., linkages are not required). Because a single Event (PEVENT) row can be associated with many Process Unit Group (PUNIT) rows, and because a single Process Unit Group (PUNIT) row can be associated with many Event (PEVENT) rows, a *Many to Many* relationship exists which must be resolved by a linking table (PLN\_EVENT\_UNIT).

- A. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** Permit Series (PSERIES) rows.
- B. Each Permit Series (PSERIES) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- C. Each Permit Series (PSERIES) row **must always** be linked to **one or more** Event (PEVENT) rows.

- D. Each Event (PEVENT) row **must always** be linked to **one** Permit Series (PSERIES) row.
- E. Each Handler (HBASIC) row **may or may not** be linked to **one or more** Process Unit Group (PUNIT) rows.
- F. Each Process Unit Group (PUNIT) row **must always** be linked to **one** Handler (HBASIC) row.
- G. Each Process Unit Group (PUNIT) row **must always** be linked to **one or more** Process Unit Detail (PUNIT\_DETAIL) rows.
- H. Each Process Unit Detail (PUNIT\_DETAIL) row **must always** be linked to **one** Process Unit (PUNIT) row.
- I. Each Event (PEVENT) row **may or may not** be linked to **one or more** Event to Unit Group Linking (PLN\_EVENT\_UNIT) rows.
- J. Each Event to Unit Group Linking Table (PLN\_EVENT\_UNIT) row **must always** be linked to **one** Event (PEVENT) row.
- K. Each Process Unit (PUNIT) row **may or may not be** be linked to **one or more** Event to Unit Group Linking (PLN\_EVENT\_UNIT) rows.
- L. Each Event to Unit Linking (PLN\_EVENT\_UNIT) row **must always** be linked to **one** Process Unit (PUNIT) row.
- M. Each Process Unit Detail (PUNIT\_DETAIL) row **may or may not** be linked to **one or more** Event to Unit Group Linking (PLN\_EVENT\_UNIT) rows.
- N. Each Event to Unit Group Linking (PLN\_EVENT\_UNIT) row **must always** be linked to **one** Process Unit Detail (PUNIT\_DETAIL) row.

## 2.8.2 Permitting Transaction Processing

A transaction code (TRANS\_CODE) must be present in each flat file for each record to indicate whether the modification is an *Add/Update* (TRANS\_CODE = **C**) or a *Delete* (TRANS\_CODE = **D**).

### 2.8.2.1 P1 (PSERIES) Flat File

PSERIES data is fixed IOR; either the State or Region owns all of the data in this table for a given state or territory (ACTIVITY\_LOCATION). PSERIES data must be owned by the translator to effect any changes to the table.

#### 2.8.2.1.1 Add/Update

To add or update a Permit Series table row, TRANS\_CODE must be = **C**.

- To update a Permit series table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row matching the key columns HANDLER\_ID **plus** SERIES\_SEQ owned by the translator must exist in the PSERIES table.

- To create a new P SERIES row, a row matching the key columns HANDLER\_ID **plus** SERIES\_SEQ owned by the translator must **not** currently exist in the P SERIES table.

**Note:** A P SERIES table row must be linked to one or more P EVENT table rows. When adding a new Permit Series, translators must include the event data in the P2 (P EVENT) flat file. If this data is not provided, referential integrity violations will occur.

An Event should be linked to one or more P UNIT table rows. When adding a new Permit Series, translators should include the event to unit group linkage data in the P5 (PLN\_EVENT\_UNIT) flat file. Although RCRAInfo does not currently utilize database constraints to require mandatory linkages, the RCRAInfo data entry software will require that all Events be linked to one or more Process Units. This is to allow implementers time to clean up their data, but enforce data quality for data that is created or modified. However, database constraints may be implemented to mandate the linkages in the future.

#### 2.8.2.1.2 Delete

In order to delete a Permit Series, the P1 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID and SERIES\_SEQ are provided. Rows in other related flat files representing the delete Permit Series transaction must **NOT** be present. Deleting a Permit Series for a Handler ID will automatically *cascade delete* all associated rows in the P EVENT and PLN\_EVENT\_UNIT tables. Related delete transactions in the P EVENT and PLN\_EVENT\_UNIT flat files will cause errors because the data will have been previously deleted via the P1 flat file "Delete Permit Series" transaction.

**Note:** If any entries exist in the P EVENT table for a Handler ID which have an owner other than the owner specified in the translator control file, the transaction will not be processed, and an error will result. Before deletion of the permit series can proceed, the co-implementer must separately delete all related data (i.e., any events that are associated with the permit series and related unit groups).

#### 2.8.2.2 P2 (P EVENT) Flat File

P EVENT data is variable IOR; the decision field is *Responsible Agency*. The translator must be the responsible agency owner for the specified event for a given ACTIVITY\_LOCATION in order to effect any changes to the P EVENT table.

##### 2.8.2.2.1 Add/Update

To add or update a Permit Event, TRANS\_CODE must = **C**.

- To update a Permit Event, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row matching the key columns HANDLER\_ID **plus** SERIES\_SEQ **plus** OWNER (of permit event code) **plus** PERMIT\_EVENT\_CODE **plus** ACTIVITY\_LOCATION **plus** RESPONSIBLE\_AGENCY **plus** EVENT\_SEQUENCE\_NUMBER owned by the translator must exist in the P EVENT table.

- To create a new PEVENT row, a row matching the key columns concatenated together owned by the translator must not currently exist in the PEVENT table.

#### 2.8.2.2.2 Delete

To delete a Permit Event and all associations to a Permit Series and any Unit Groups, the P2 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, SERIES\_SEQ, OWNER (of permit event code), PERMIT\_EVENT\_CODE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY, and EVENT\_SEQUENCE\_NUMBER are provided.

Rows in the P5 (PLN\_EVENT\_UNIT) flat file representing the Delete Permit Event transaction must NOT be present. Deleting a Permit Event row from the PEVENT table will automatically *cascade delete* any associated rows from the PLN\_EVENT\_UNIT table. Related delete transactions in the PLN\_EVENT\_UNIT flat file will cause errors because the data will have been previously deleted.

**Note:** Deleting an event row from the PEVENT table is NOT the same as disassociating an event from a unit group. “Unlinking” transactions are performed via the linking P5 flat file (PLN\_EVENT\_UNIT).

#### 2.8.2.3 P3 (PUNIT) Flat File

PUNIT data is fixed IOR and should have same owner as for P SERIES data. The translator must be owner of PUNIT data for a given state or territory to effect any changes to the PUNIT table.

##### 2.8.2.3.1 Add/Update

To add or update data for a process unit group, TRANS\_CODE must = **C**.

- To update a process unit group, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row matching the key columns HANDLER\_ID **plus** UNIT\_SEQ owned by the translator must exist in the PUNIT table.
- To create a new PUNIT row, the key columns concatenated together must not currently exist in the PUNIT table.

**Note:** A PUNIT table row must be linked to one or more PUNIT\_DETAIL table rows. When adding a new Process Unit Group, translators must include the Process Unit Detail data in the P4 (PUNIT\_DETAIL) flat file. If this data is not provided, referential integrity violations will occur.

##### 2.8.2.3.2 Delete

To delete a Process Unit Group and all associations to Unit Group Detail rows and Permitting Event row(s), the P3 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID and UNIT\_SEQ are provided.

Rows in the P5 (PLN\_EVENT\_UNIT) flat file representing the Delete Process Unit Group transaction and/or P4 (PUNIT\_DETAIL) flat file must **NOT** be included. Deleting a Process Unit Group row from the PUNIT table will automatically *cascade delete* all associated rows from the PUNIT\_DETAIL and PLN\_EVENT\_UNIT tables. Delete transactions in related flat files will cause errors because the data will have been previously deleted.

**Note:** If any entries exist in the PLN\_EVENT\_UNIT table for a Handler ID which have an owner other than the owner specified in the translator control file, the transaction will not be processed, and an error will result. Before deletion of the process unit group can proceed, the co-implementer must separately delete all event to unit group linkages it owns (i.e., any events that are associated with the unit group being deleted).

#### 2.8.2.4 P4 (PUNIT\_DETAIL) Flat File

PUNIT\_DETAIL data is fixed IOR and should have same owner as for PUNIT data (and P SERIES as well). The translator must be owner of the P SERIES/PUNIT/PUNIT\_DETAIL data for a given state or territory to effect any changes to the PUNIT\_DETAIL table.

##### 2.8.2.4.1 Add/Update

To add or update a process unit group detail row, TRANS\_CODE must = **C**.

- To update a process unit group detail row, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row matching the key columns HANDLER\_ID **plus** UNIT\_SEQ **plus** UNIT\_DETAIL\_SEQ owned by the translator must exist in the PUNIT\_DETAIL table.
- To create a new PUNIT\_DETAIL row, the key columns concatenated together must not currently exist in the PUNIT\_DETAIL table.

##### 2.8.2.4.2 Delete

To delete a Process Unit Group Detail row and its association with the PUNIT parent row and Event row(s), the P4 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** UNIT\_SEQ **plus** UNIT\_DETAIL\_SEQ are provided.

#### 2.8.2.5 P5 (PLN\_EVENT\_UNIT) Flat File

PLN\_EVENT\_UNIT data is variable IOR; the decision field is *Responsible Agency* in the P EVENT table. The translator must be the owner of the associated P EVENT row. (The translator does not have to own the Permit Series or Process Unit Group data in order to add and maintain an event.)

**Note:** All fields in the P5 Flat File are required, and must be provided to effect a transaction.

#### 2.8.2.5.1 Add/Update

To add an Event to Process Unit Group link, TRANS\_CODE must = **C** and key columns, which when concatenated together are unique and do not exist in the database, must be present.

**Note:** Update transactions are inappropriate for linkage tables because all columns in the table are keys which cannot be updated directly. To change a key, the row must be deleted and then recreated using the revised key.

#### 2.8.2.5.2 Delete

Deleting a row from the PLN\_EVENT\_UNIT table removes the association between an event and a process unit group. It does **not** delete the event or unit group. TRANS\_CODE must = **D**, and key fields HANDLER\_ID, SERIES\_SEQ, OWNER (of permit event code), PERMIT\_EVENT\_CODE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY, EVENT\_SEQ, and UNIT\_SEQ must be supplied. If a match is found in the PLN\_EVENT\_UNIT table owned by the translator, the row will be deleted.

### 2.9 Corrective Action Subject Area

The Corrective Action program addresses the cleanup of hazardous waste releases at RCRA-regulated sites. States and EPA Regions provide data on the requirements imposed to address releases of hazardous waste. Sites provide States and EPA with information concerning corrective actions undertaken. The Corrective Action Subject Area of RCRAInfo is divided into three primary components: *Corrective Action Areas*, *Corrective Action Authorities*, and *Corrective Action Events*.

A *Corrective Action Area* refers to the area of concern for release cleanup. In RCRAInfo, a Corrective Action Area is assigned a *Sequence Number* and an *Area Name* which is stored in the AAREA table. An *Area Facility-Wide Flag* has been established to indicate that the area refers to the entire facility. A *Notes* column is used to enter a longer description of the area. The option to track the *EPA or State Responsible Person* is available. Columns to indicate *releases to groundwater, surface water, soil, and air* are contained in this table to be supplied as appropriate upon issuance of a Corrective Action authority.

A *Corrective Action Authority* (formerly called Corrective Action Instrument) provides the legal instrument or the programmatic basis for undertaking the corrective action process. Examples are Consent Authority, Consent Decree, Voluntary CA, Interim Status, and Policy Requirement (NCAPS ranking, stabilization evaluation). In RCRAInfo, a Corrective Action Authority is defined via its *Effective Date*, *Authority Type*, and *Responsible Agency*. Other data stored in the ACA\_AUTHORITY table are *Issuance* and *Revocation Dates*, whether an *Information Repository* has been established, and entities responsible for the Authority (*Responsible Person*, *Responsible Attorney*, *Lead Program*, *Lead Suborganization*). Each Corrective Action Authority may be associated with one or more *Statutes or Citations* (formerly Legal Authority) contained in the ASTATUTE\_CITATION table. Notes may be supplied for rows in both the Authority and Statute/Citation tables. Optional linkages may be created between Handler Basic (HBASIC) and CA Authority to allow an Authority row to be created before it is linked to an Event row.

Each Corrective Action Area and each Corrective Action Authority may be associated with many *Corrective Action Event* milestones. Corrective Action Event milestone data is stored in the AEVENT table. Because a particular event can occur more than once over time, a *Sequence Number* is used as part of the key to differentiate between them. Because more than one organization can establish

events, *Event Responsible Agency* is used to ensure uniqueness. *Scheduled, Revised, and Actual Completion Dates* for the event are maintained here. *Event Responsible Person* and *Suborganization*, and *Notes* may be optionally supplied. Because each event may be associated with many areas and each area may be associated with many events, a *linking table* which supplies the key values to link event data to area data and conversely, area data to event data (ALN\_AREA\_EVENT) is maintained.

Because each event may be associated with many authorities and each authority may be linked to many events, another linking table which supplies the key values to link event data to authority data and authority data to event data (ALN\_EVENT\_AUTHORITY) is required.

### 2.9.1 Corrective Action Subject Area Entity Relationships

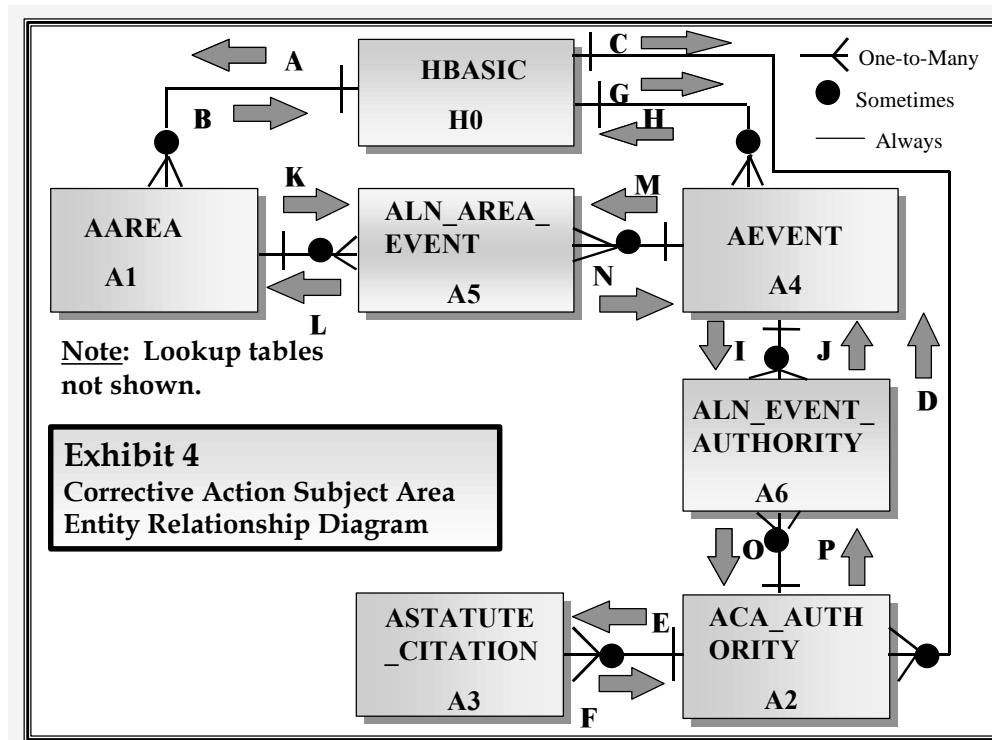

Exhibit 4 provides a graphical depiction of the entities (tables) in the Corrective Action subject area, and the relationships between them. Refer to the legend below for description of each relationship. Each table is directly related to a corresponding flat file. The “crows feet” indicate a one-to-many relationship between rows in two linked tables. The vertical bars indicate mandatory relationships (i.e., linkages are required). The circles indicate optional relationships (i.e., linkages are not required). Because a single Area (AAREA) row can be associated with many Event (AEVENT) rows, and because a single Event (AEVENT) row can be associated with many Area (AAREA) rows, a *Many to Many* relationship exists which must be resolved by a linking table (ALN\_AREA\_EVENT).

- A. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CA Area (AAREA) rows.

- B. Each CA Area (AAREA) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- C. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CA Authority (ACA\_AUTHORITY) rows.
- D. Each CA Authority (ACA\_AUTHORITY) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- E. Each CA Authority (ACA\_AUTHORITY) row **may or may not** be linked to **one or more** CA Statute/Citation (ASTATUTE\_CITATION) rows.
- F. Each CA Statute/Citation (ASTATUTE\_CITATION) row **must always** be linked to **one** CA Authority (ACA\_AUTHORITY) row.
- G. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CA Event (AEVENT) rows.
- H. Each CA Event (AEVENT) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- I. Each CA Event (AEVENT) row **may or may not** be linked to **one or more** CA Event to Authority Linking (ALN\_EVENT\_AUTHORITY) rows.
- J. Each CA Event to Authority Linking (ALN\_EVENT\_AUTHORITY) row **must always** be linked to **one** CA Event (AEVENT) row.
- K. Each CA Area (AAREA) row **may or may not** be linked to **one or more** Area to Event Linking (ALN\_AREA\_EVENT) rows.
- L. Each Area to Event Linking Table (ALN\_AREA\_EVENT) row **must always** be linked to **one** CA Event (AEVENT) row.
- M. Each CA Event (AEVENT) row **may or may not** be linked to **one or more** Area to Event Linking (ALN\_AREA\_EVENT) rows.
- N. Each Area to Event Linking Table (ALN\_AREA\_EVENT) row **must always** be linked to **one** CA Event (AEVENT) row.
- O. Each Event to Authority Linking Table (ALN\_EVENT\_AUTHORITY) row **must always** be linked to **one** ACA\_AUTHORITY row.
- P. Each Authority (ACA\_AUTHORITY) row **may or may not** be linked to **one or more** Event to Authority Linking Table (ALN\_EVENT\_AUTHORITY) rows.

### 2.9.2 Corrective Action Transaction Processing

A transaction code (TRANS\_CODE) must be present in each flat file for each record to indicate whether the modification is an *Add/Update* (TRANS\_CODE = **C**) or a *Delete* (TRANS\_CODE = **D**).

### 2.9.2.1 A1 (AAREA) Flat File

AAREA data is fixed IOR; either the State or the Region owns all of the data for a given state or territory in this table. AAREA must be owned by the translator to effect any changes to the table.

#### 2.9.2.1.1 Add/Update

To add or update an Area table row, TRANS\_CODE must = **C**.

- To update an Area table row, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row matching the key columns HANDLER\_ID **plus** AREA\_SEQ owned by the translator must exist in the AAREA table.
- To create a new Area table row, the key columns HANDLER\_ID **plus** AREA\_SEQ must **not** currently exist in the AAREA table.

**Note:** An AAREA table row should be linked to one or more AEVENT table rows. When adding a new Corrective Action Area, translators should include the area to event linkage data in the A5 (ALN\_AREA\_EVENT) flat file, the event data in the A4 (AEVENT) flat file, authority data in the A2 (ACA\_AUTHORITY) flat file, and statute/citation data in the A3 (ASTATUTE\_CITATION) flat file, and the event to authority linkage data in the A6 (ALN\_EVENT\_AUTHORITY) flat file.

Although RCRAInfo does not currently utilize database constraints to require mandatory linkages, the RCRAInfo data entry software will require that all Events be linked to an Area. This is to allow implementers time to clean up their data, but enforce data quality for data that is created or modified. However, in the future, database structure constraints will most likely be implemented to mandate these linkages. Also, be aware that the EPA Headquarters Program Accomplishments Report (PARS) select logic will ignore corrective action event data that is not linked.

#### 2.9.2.1.2 Delete

In order to delete a Corrective Action Area, the A1 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID and AREA\_SEQ are provided. Rows in other related flat files representing the Delete Area transaction must **NOT** be present. Deleting a Corrective Action Area for a Handler ID will automatically *cascade delete* all associated rows in the ALN\_AREA\_EVENT table. Related delete transactions in the ALN\_AREA\_EVENT table would cause the translator load process to terminate unsuccessfully because the data will have been previously deleted via the A1 flat file "Delete Corrective Action Area" transaction.

### 2.9.2.2 A2 (ACA\_AUTHORITY) Flat File

ACA\_AUTHORITY data is variable IOR; the decision field is *Authority Responsible Agency*. The translator must be the responsible agency owner for the given ACTIVITY\_LOCATION for the specified authority row in order to effect any changes to the ACA\_AUTHORITY table.

#### 2.9.2.2.1 Add/Update

To add or update a Corrective Action Authority, TRANS\_CODE must = **C**.

- To update a Corrective Action Authority, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** OWNER (of authority type code) **plus** AUTHORITY\_TYPE **plus** ACTIVITY\_LOCATION **plus** RESPONSIBLE\_AGENCY (for authority) **plus** EFFECTIVE\_DATE must exist in the ACA\_AUTHORITY table.
- To create a new ACA\_AUTHORITY row, the key columns concatenated together must **not** currently exist in the ACA\_AUTHORITY table.

**Note:** An ACA\_AUTHORITY table row should be associated with one or more ASTATUTE\_CITATION table rows. When adding a new ACA\_AUTHORITY row, translators should include the statute/citation data in the A3 (ASTATUTE\_CITATION) flat file.

#### 2.9.2.2.2 Delete

To delete a Corrective Action Authority and associations to a statute/citation(s), the A2 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, OWNER (of authority type code), AUTHORITY\_TYPE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY (for authority), and EFFECTIVE\_DATE are provided.

Rows in the A3 (ASTATUTE\_CITATION) flat file representing the Delete Corrective Action Authority transaction must NOT be included. Deleting a Corrective Action Authority row from the ACA\_AUTHORITY table will automatically *cascade delete* any associated row(s) from the ASTATUTE\_CITATION table. Related delete transactions in the ASTATUTE\_CITATION flat file will cause the translator load process to terminate because the data will have been previously deleted.

#### 2.9.2.3 A3 (ASTATUTE\_CITATION) Flat File

ASTATUTE\_CITATION data is variable IOR; the decision field is *Authority Responsible Agency*. The translator must be the responsible agency owner for the given ACTIVITY\_LOCATION for the specified authority row in the ACA\_AUTHORITY table in order to effect any changes to the ASTATUTE\_CITATION table.

##### 2.9.2.3.1 Add/Update

To add or update a Corrective Action Statute/Citation, TRANS\_CODE must = **C**.

- To update a Corrective Action Authority, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** OWNER (of authority type code) **plus** AUTHORITY\_TYPE **plus** ACTIVITY\_LOCATION **plus** RESPONSIBLE\_AGENCY (for authority) **plus** EFFECTIVE\_DATE **plus** OWNER (of statutory citation code) **plus** STATUTORY\_CITATION must exist in the ASTATUTE\_CITATION table.
- To create a new ASTATUTE\_CITATION row, the key columns concatenated together must **not** currently exist in the ASTATUTE\_CITATION table.

#### 2.9.2.4 A4 (AEVENT) Flat File

AEVENT data is variable IOR; the decision field is *Event Responsible Agency*. The translator must be the responsible agency for the specified event for the given ACTIVITY\_LOCATION in order to effect any changes to the AEVENT table.

##### 2.9.2.4.1 Add/Update

To add or update a Corrective Action Event, TRANS\_CODE must = **C**.

- To update a Corrective Action Event, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key fields HANDLER\_ID **plus** OWNER (of corrective action event code) **plus** CA\_EVENT\_CODE **plus** ACTIVITY\_LOCATION **plus** RESPONSIBLE\_AGENCY **plus** EVENT\_SEQ must exist in the AEVENT table.
- To create a new AEVENT row, the key columns concatenated together must **not** currently exist in the AEVENT table.

**Note:** An AEVENT table row should be linked to a ACA\_AUTHORITY table row through the ALN\_EVENT\_AUTHORITY linking table. An ACA\_AUTHORITY row, should in turn, be linked to one or more ASTATUTE\_CITATION rows. When adding a new Corrective Action Event, translators should include the authority data in the A2 (ACA\_AUTHORITY) flat file, the statute/citation data in the A3 (ASTATUTE\_CITATION) flat file, and link the event to an authority in the A6 (ALN\_EVENT\_AUTHORITY) flat file. A linkage record to an Area should also be included in the A5 (ALN\_AREA\_EVENT) flat file.

Although RCRAInfo does not currently utilize database constraints to require mandatory linkages, the RCRAInfo data entry software will require that all Events be linked to an Area. This is to allow implementers time to clean up their data, but enforce data quality for data that is created or modified. However, in the future, database structure constraints will most likely be implemented to mandate these linkages. Also, be aware that the EPA Headquarters Program Accomplishments Reports (PARS) will ignore corrective action event data that is not linked.

##### 2.9.2.4.2 Delete

To delete a Corrective Action Event and all associations to an Area, Authorities, and Statute/Citations, the A4 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID, OWNER (of corrective action event code), CA\_EVENT\_CODE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY, and EVENT\_SEQ are provided.

##### 2.9.2.4.2 Delete (continued)

Rows in the A5 (ALN\_AREA\_EVENT) flat file representing the Delete Corrective Action Event transaction must NOT be present. Deleting a Corrective Action Event row from the AEVENT table will automatically *cascade delete* any associated rows from the ALN\_AREA\_EVENT, ACA\_AUTHORITY, and ASTATUTE\_CITATION tables. Related delete transactions in the associated flat files will cause the translator load process to terminate because the data will have been previously deleted.

**Note:** Deleting an event row from the AEVENT table is NOT the same as disassociating an event from an Area. “Unlinking” transactions are performed via the linking A5 flat file (ALN\_AREA\_EVENT).

**Note:** If any entries exist in the ACA\_AUTHORITY table for an Event for a particular Handler ID which have an authority responsible agency owner other than the owner specified in the translator control file, the transaction will not be processed, and the translator load will not complete. Before deletion of an Event can proceed, the co-implementer must delete all related data (i.e., any authorities that are associated with the event and related statute/citations).

#### 2.9.2.5 A5 (ALN\_AREA\_EVENT) Flat File

ALN\_AREA\_EVENT data is variable IOR; the decision filed is *Event Responsible Agency* in the AEVENT table. The translator must be the owner of the associated AEVENT row for the given ACTIVITY\_LOCATION. (The translator does not have to own the Corrective Action Area data in order to add and maintain an event.)

##### 2.9.2.5.1 Add/Update

To add an Area to Event link, TRANS\_CODE must = **C** and key columns, which when concatenated together are unique and do not exist in the database, must be present.

**Note:** Update transactions are inappropriate for linkage tables because all columns in the table are keys which cannot be updated directly. To change a key, the row must be deleted and then recreated using the revised key.

##### 2.9.2.5.2 Delete

Deleting a row from the ALN\_AREA\_EVENT table removes the association between an area and an event. It does not delete the area or event. TRANS\_CODE must be = **D**, and key fields HANDLER\_ID, AREA\_SEQ, OWNER (of corrective action event code), CA\_EVENT\_CODE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY, and EVENT\_SEQ must be supplied. If a match is found in the ALN\_AREA\_EVENT table owned by the translator, the row will be deleted.

#### 2.9.2.6 A6 (ALN\_EVENT\_AUTHORITY) Flat File

ALN\_EVENT\_AUTHORITY data is variable IOR; the decision filed is *Event Responsible Agency* in the AEVENT table. The translator must be the owner of the associated AEVENT row for the given ACTIVITY\_LOCATION. (The translator does not have to own the associated Corrective Action Authority data in order to add and maintain a linkage from an event to an authority.)

##### 2.9.2.6.1 Add/Update

To add an Event to Authority link, TRANS\_CODE must = **C** and key columns, which when concatenated together are unique and do not exist in the database, must be present.

**Note:** Update transactions are inappropriate for linkage tables because all columns in the table are keys which cannot be updated directly. To change a key, the row must be deleted and then recreated using the revised key.

#### 2.9.2.6.2 Delete

Deleting a row from the ALN\_EVENT\_AUTHORITY table removes the association between an event and an authority. It does **not** delete the event or authority. TRANS\_CODE must be = **D**, and key fields HANDLER\_ID, OWNER (of corrective action event code), CA\_EVENT\_CODE, ACTIVITY\_LOCATION, RESPONSIBLE\_AGENCY (for event), EVENT\_SEQ, OWNER (of authority code), AUTHORITY\_TYPE, RESPONSIBLE\_AGENCY (for authority), and EFFECTIVE DATE must be supplied. If a match is found in the ALN\_EVENT\_AUTHORITY table owned by the translator, the row will be deleted.

### 2.10 Compliance Monitoring & Enforcement Subject Area

The Compliance Monitoring & Enforcement program verifies the compliance with hazardous waste both Federal and State regulations and statutes at RCRA-regulated sites. State and Regional compliance staff provide information about the completion of evaluations/inspections, the existence of violations, and enforcement activities that are being taken against hazardous waste handlers to ensure compliance with the regulations. The Compliance Monitoring & Enforcement Subject Area of RCRAInfo is divided into three primary components: *Evaluations*, *Violations*, and *Enforcement Actions*.

An *Evaluation* captures information about inspections and evaluations of facilities' compliance status. In RCRAInfo, a CM&E Evaluation is defined by the *Handler ID*, *Activity Location*, *Sequence Number*, *Evaluation Date and Agency* in the CEVALUATION table. A *Found Violation* field has been established to indicate whether or not the evaluation found any violations, or whether the agency is still determining violations. *Evaluation Type* further describes the evaluation. A *Notes* column is used to enter comments related to the evaluation. *Coverage Area* is provided to optionally specify the areas covered by the evaluation and is stored in the CEVALUATION\_AREA table. The option to indicate the *Reason* for the evaluation, the *Staff* who performed the evaluation and the *Suborganization*, formally known as Branch are available.

A *Violation* indicates that a problem was discovered by an evaluation of the facility. In RCRAInfo, a Violation is defined via the *Handler ID*, *Activity Location*, *Sequence Number* and the *Determined By Agency*. Other data stored in the CVIOLATION table are *Determined Date*, *Violation Type*, *Citation Type*, a text field for listing the actual *Citation*, the *Actual RTC Date* (Returned to Compliance date), the *Responsible Agency*, the *Class*, and *Priority*. The option to indicate the *Staff* assigned to the violation and the *Suborganization*, formally known as Branch are available. The new field *RTC Qualifier Type* has been added to allow for the closing (returning to full physical compliance) of violations for reasons other than observed. Each Violation must be associated with one or more Evaluations via the CLN\_EVALUATION\_VIOLATION linking table. A *Notes* column is used to enter a comments related to the violation. Violations many have one or more *Schedule Compliance Date* ordered by one or more enforcement action, this date and link is stored in the CLN\_COMPLIANCE\_SCHEDULE linking table.

An *Enforcement* addresses violations which were discovered at the facility. In RCRAInfo, an Enforcement is defined by: *Handler ID*, *Activity Location*, *Sequence Number*, *Enforcement Date* and *Agency*. Other data stored in the CENFORCEMENT table are *Docket number*, *Enforcement Type* and *Attorney*. The option to indicate the *Staff* assigned to the violation and the *Suborganization*, formally known as Branch are available. Enforcement actions may a *Schedule Compliance* date which is stored in the CLN\_COMPLIANCE\_SCHEDULE linking table. Multiple penalties can be assessed by an enforcement action and are stored in the CPENALTY table. The CPENALTY table is defined *Penalty Type* and stores *Amount* and *Notes* related to the penalty. Payments are paid against penalties, therefore CPAYMENT is always defined by one or more CPENALTY. The CPAYMENT table is defined

by *Sequence Number* and stores the *Scheduled Date* and *Scheduled Amount* of the payment, and the *Paid Date* and *Paid Amount* of the payment. It also provided a *Notes* field to enter comments related to the payment. Since an enforcement action may involve other media a CMEDIA table provided the opportunity to record *Media Type* and *Notes*. Supplemental Environmental Projects (SEPs) may be ordered by the enforcement action, the CSEP table stores this information. SEPs are defined by *Sequence Number*. Other information stored related to SEPs is *SEP Type*, *Expenditure Amount*, *Scheduled Date*, *Actual Date*, *Staff*, and *Notes* relating to the SEP.

State and Regional compliance staff provide information about the completion of inspections, the existence of violations of RCRA or State regulations, and enforcement activities that are being taken against hazardous waste handlers to ensure compliance with the regulations.

### 2.10.1 Compliance Monitoring & Enforcement Subject Area Entity Relationships

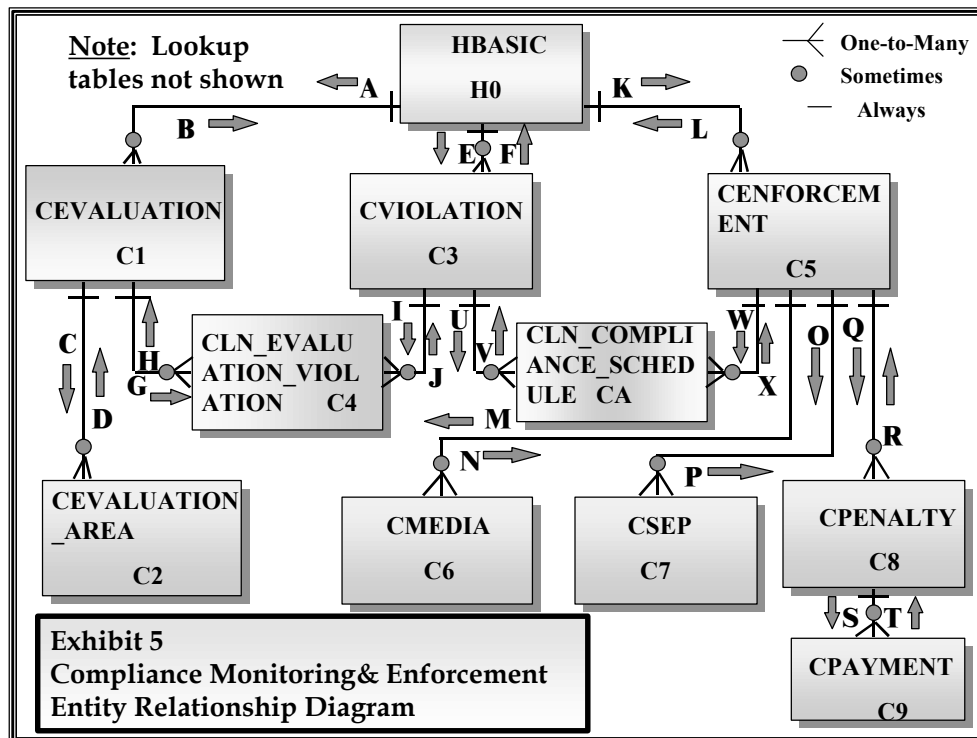

Exhibit 5 provides a graphical depiction of the entities (tables) in the Compliance Monitoring & Enforcement subject area, and the relationships between them. Refer to the legend below for a description of each relationship. Each table is directly related to a corresponding flat file. The “crows feet” indicate a one-to-many relationship between rows in two linked tables. The vertical bars indicate mandatory relationships (i.e., linkages are required). The circles indicate optional relationships (i.e., linkages are not required).

- A. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CM&E Evaluation (CEVALUATION) rows.
- B. Each CM&E Evaluation (CEVALUATION) row **must always** be linked to **one** Handler Basic (HBASIC) row.

- C. Each CM&E Evaluation (CEVALUATION) row **may or may not** be linked to **one or more** CM&E Evaluation Area (CEVALUATION\_AREA) rows.
- D. Each CM&E Evaluation Area (CEVALUATION\_AREA) row **must always** be linked to **one** CM&E Evaluation (CEVALUATION).
- E. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CM&E Violation (CVIOLATION) rows.
- F. Each CM&E Violation (CVIOLATION) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- G. Each CM&E Evaluation (CEVALUATION) row **may or may not** be linked to **one or more** CM&E Evaluation to Violation linking Table (CLN\_EVALUATION\_VIOLATION) rows.
- H. Each CM&E Evaluation to Violation linking Table (CLN\_EVALUATION\_VIOLATION) row **must always** be linked to **one** CM&E Evaluation (CEVALUATION) row.
- I. Each CM&E Violation (CVIOLATION) row **may or may not** be linked to **one or more** CM&E Evaluation to Violation linking Table (CLN\_EVALUATION\_VIOLATION) rows.
- J. Each CM&E Evaluation to Violation linking Table (CLN\_EVALUATION\_VIOLATION) row **must always** be linked to **one** CM&E Violation (CVIOLATION) row.
- K. Each Handler Basic (HBASIC) row **may or may not** be linked to **one or more** CM&E Enforcement (CENFORCEMENT) rows.
- L. Each CM&E Enforcement (CENFORCEMENT) row **must always** be linked to **one** Handler Basic (HBASIC) row.
- M. Each CM&E Enforcement (CENFORCEMENT) row **may or may not** be linked to **one or more** CM&E Multimedia (CMEDIA) rows.
- N. Each CM&E Multimedia (CMEDIA) row **must always** be linked to **one** CM&E Enforcement (CENFORCEMENT) row.
- O. CM&E Enforcement (CENFORCEMENT) row **may or may not** be linked to **one or more** CM&E SEP (CSEP) rows.
- P. Each CM&E SEP (CSEP) row **must always** be linked to **one** CM&E Enforcement (CENFORCEMENT) row.
- Q. CM&E Enforcement (CENFORCEMENT) row **may or may not** be linked to **one or more** CM&E Penalty (CPENALTY) rows.
- R. Each CM&E Penalty (CPENALTY) row **must always** be linked to **one** CM&E Enforcement (CENFORCEMENT) row.

- S. CM&E Penalty (CPENALTY) row **may or may not** be linked to **one or more** CM&E Payment (CPAYMENT) rows.
- T. Each CM&E Payment (CPAYMENT) row **must always** be linked to **one** CM&E Penalty (CPENALTY) row.

## 2.10.2 Compliance Monitoring & Enforcement Transaction Processing

A transaction code (TRANS\_CODE) must be present in each flat file for each record to indicate whether the modification is an *Add/Update* (TRANS\_CODE = **C**) or a *Delete* (TRANS\_CODE = **D**).

### 2.10.2.1 C1 (CEVALUATION) Flat File

CEVALUATION data is variable IOR; the decision field is *Agency*. The translator must be the responsible agency owner for the given ACTIVITY\_LOCATION for the specified evaluation row in order to effect any changes to the CEVALUATION table.

#### 2.10.2.1.1 Add/Update

To add or update an Evaluation, TRANS\_CODE must = **C**.

- To update an Evaluation, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** EVALUATION\_DATE **plus** EVALUATION\_SEQ **plus** AGENCY must exist in the CEVALUATION table.
- To create a new CEVALUATION row, the key columns concatenated together must **not** currently exist in the CEVALUATION table.

#### 2.10.2.1.2 Delete

To delete a CM&E Evaluation, the C1 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** EVALUATION\_DATE **plus** EVALUATION\_SEQ **plus** AGENCY are provided.

Rows in the C2 (CEVALUATION\_AREA) flat file, the C3 (CVIOLATION) flat file, the C4 (CLN\_EVALUATION\_VIOLATION) flat file, the CA (CLN\_COMPLIANCE\_SCHEDULE) flat file, the C5 (CENFORCEMENT) flat file, the C6 (CMEDIA) flat file, the C7 (CSEP) flat file, the C8 (CPENALTY) flat file and C9 (CPAYMENT) flat file representing the Delete CM&E Evaluation transaction must **NOT** be included. Deleting a CM&E Evaluation row from the CEVALUATION table will automatically *cascade delete* any associated row(s) from the CEVALUATION\_AREA table, the CVIOLATION table, the CLN\_EVALUATION\_VIOLATION linking table, the CLN\_COMPLIANCE\_SCHEDULE linking table, the CENFORCEMENT table, the CMEDIA table, the CSEP table, the CPENALTY table and the CPAYMENT table. Related delete transactions in those flat files will cause the translator load process to terminate because the data will have been previously deleted.

### 2.10.2.2 C2 (CEVALUATION\_AREA) Flat File

CEVALUATION\_AREA data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified evaluation area row in order to effect any changes to the CEVALUATION\_AREA table.

#### 2.10.2.2.1 Add/Update

To add or update an Evaluation Area, TRANS\_CODE must = **C**.

- To update an Evaluation Area, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** OWNER (of area type code) **plus** AREA\_TYPE **plus** ACTIVITY\_LOCATION **plus** AGENCY **plus** EVALUATION\_DATE **plus** EVALUATION\_SEQ must exist in the CEVALUATION\_AREA table.
- To create a new CEVALUATION\_AREA row, the key columns concatenated together must **not** currently exist in the CEVALUATION\_AREA table.

#### 2.10.2.2.2 Delete

To delete a CM&E Evaluation Area, the C2 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** OWNER (of area type code) **plus** AREA\_TYPE **plus** ACTIVITY\_LOCATION **plus** AGENCY **plus** EVALUATION\_DATE **plus** EVALUATION\_SEQ are provided.

Rows in the C3 (CVIOLATION) flat file, the C4 (CLN\_EVALUATION\_VIOLATION) flat file, the CA (CLN\_COMPLIANCE\_SCHEDULE) flat file, the C5 (CENFORCEMENT) flat file, the C6 (CMEDIA) flat file, the C7 (CSEP) flat file, the C8 (CPENALTY) flat file and C9 (CPAYMENT) flat file representing the Delete CM&E Evaluation Area transaction must **NOT** be included. Deleting a CM&E Evaluation Area row from the CEVALUATION\_AREA table will automatically *cascade delete* any associated row(s) from the CVIOLATION table, the CLN\_EVALUATION\_VIOLATION linking table, the CLN\_COMPLIANCE\_SCHEDULE linking table, the CENFORCEMENT table, the CMEDIA table, the CSEP table, the CPENALTY table and the CPAYMENT table. Related delete transactions in those flat files will cause the translator load process to terminate because the data will have been previously deleted.

### 2.10.2.3 C3 (CVIOLATION) Flat File

CVIOLATION data is variable IOR; the decision field is *Responsible Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CVIOLATION table.

#### 2.10.2.3.1 Add/Update

To add or update a Violation, TRANS\_CODE must = **C**.

- To update a Violation, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns **HANDLER\_ID plus ACTIVITY\_LOCATION plus DETERMINED BY AGENCY plus VIOLATION\_SEQ** must exist in the CVIOLATION table.
- To create a new CVIOLATION row, the key columns concatenated together must **not** currently exist in the CVIOLATION table.

**Note:** A CVIOLATION table row must be linked to one or more CEVALUATION table rows. When adding a new Violation, translators must include the Evaluation data in the C1 (CEVALUATION) flat file and the linkage record to the Evaluation must also be included in the C4 (CLN\_EVALUATION\_VIOLATION) flat file.

**RCRAInfo will utilize database constraints to require mandatory linkages.**

#### 2.10.2.3.2 Delete

To delete a CM&E Violation, the C3 flat file must contain a record where TRANS\_CODE = **D** and the key fields **HANDLER\_ID plus ACTIVITY\_LOCATION plus DETERMINED BY AGENCY plus VIOLATION\_SEQ** are provided.

Rows in the C4 (CLN\_EVALUATION\_VIOLATION) flat file, the CA (CLN\_COMPLIANCE\_SCHEDULE) flat file, the C5 (CENFORCEMENT) flat file, the C6 (CMEDIA) flat file, the C7 (CSEP) flat file, the C8 (CPENALTY) flat file and C9 (CPAYMENT) flat file representing the Delete CM&E Violation transaction must NOT be included. Deleting a CM&E Violation row from the CVIOLATION table will automatically *cascade delete* any associated row(s) from the CLN\_EVALUATION\_VIOLATION linking table, the CLN\_COMPLIANCE\_SCHEDULE linking table, the CENFORCEMENT table, the CMEDIA table, the CSEP table, the CPENALTY table and the CPAYMENT table. Related delete transactions in those flat files will cause the translator load process to terminate because the data will have been previously deleted.

#### 2.10.2.4 C4 (CLN\_EVALUATION\_VIOLATION) Flat File

CLN\_EVALUATION\_VIOLATION data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CLN\_EVALUATION\_VIOLATION table.

##### 2.10.2.4.1 Add/Update

To add or update the Evaluation to Violation linking file, TRANS\_CODE must = **C**.

- To update the Evaluation to Violation linking file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns **HANDLER\_ID plus ACTIVITY\_LOCATION plus EVALUATION\_DATE plus EVALUATION\_SEQ plus AGENCY plus DETERMINED BY AGENCY plus VIOLATION\_SEQ** must exist in the CLN\_EVALUATION\_VIOLATION table.
- To create a new CLN\_EVALUATION\_VIOLATION row, the key columns concatenated together must **not** currently exist in the CLN\_EVALUATION\_VIOLATION table.

#### 2.10.2.4.2 Delete

To delete a CM&E Evaluation to Violation linking file, the C4 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** EVALUATION\_DATE **plus** EVALUATION\_SEQ **plus** AGENCY **plus** DETERMINED BY AGENCY **plus** VIOLATION\_SEQ are provided.

#### 2.10.2.5 C5 (CENFORCEMENT) Flat File

CENFORCEMENT data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CENFORCEMENT table.

##### 2.10.2.5.1 Add/Update

To add or update the Enforcement file, TRANS\_CODE must = **C**.

- To update the Enforcement file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY must exist in the CENFORCEMENT table.
- To create a new CENFORCEMENT row, the key columns concatenated together must **not** currently exist in the CENFORCEMENT table.

##### 2.10.2.5.2 Delete

To delete a CM&E Enforcement file, the C5 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY are provided.

Rows in the CA (CLN\_COMPLIANCE\_SCHEDULE) flat file, the C6 (CMEDIA) flat file, the C7 (CSEP) flat file, the C8 (CPENALTY) flat file and C9 (CPAYMENT) flat file representing the Delete CM&E Enforcement transaction must NOT be included. Deleting a CM&E Enforcement row from the CENFORCEMENT table will automatically *cascade delete* any associated row(s) from the CLN\_COMPLIANCE\_SCHEDULE table, the CMEDIA table, the CSEP table, the CPENALTY table and the CPAYMENT table. Related delete transactions in those flat files will cause the translator load process to terminate because the data will have been previously deleted.

#### 2.10.2.6 C6 (CMEDIA) Flat File

CMEDIA data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CMEDIA table.

#### 2.10.2.6.1 Add/Update

To add or update the Multimedia file, TRANS\_CODE must = **C**.

- To update the Multimedia file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** MEDIA TYPE must exist in the CMEDIA table.
- To create a new CMEDIA row, the key columns concatenated together must **not** currently exist in the CMEDIA table.

#### 2.10.2.6.2 Delete

To delete a CM&E Multimedia file, the C6 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** MEDIA TYPE are provided.

#### 2.10.2.7 C7 (CSEP) Flat File

CSEP data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CSEP table.

##### 2.10.2.7.1 Add/Update

To add or update the SEP file, TRANS\_CODE must = **C**.

- To update the SEP file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** SEP SEQ must exist in the CSEP table.
- To create a new CSEP row, the key columns concatenated together must **not** currently exist in the CSEP table.

##### 2.10.2.7.2 Delete

To delete a CM&E SEP file, the C7 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** SEP SEQ are provided.

#### 2.10.2.8 C8 (CPENALTY) Flat File

CPENALTY data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CPENALTY table.

#### 2.10.2.8.1 Add/Update

To add or update the Penalty file, TRANS\_CODE must = **C**.

- To update the Penalty file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** PENALTY TYPE must exist in the CPENALTY table.
- To create a new CPENALTY row, the key columns concatenated together must **not** currently exist in the CPENALTY table.

#### 2.10.2.8.2 Delete

To delete a CM&E Penalty file, the C8 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** PENALTY TYPE are provided.

Rows in the C9 (CPAYMENT) flat file representing the Delete CM&E Penalty transaction must NOT be included. Deleting a CM&E Penalty row from the CPENALTY table will automatically *cascade delete* any associated row(s) from the CPAYMENT table. Related delete transactions in that flat file will cause the translator load process to terminate because the data will have been previously deleted.

#### 2.10.2.9 C9 (CPAYMENT) Flat File

CPAYMENT data is variable IOR; the decision field is *Agency*. The translator must be the agency owner for the given ACTIVITY\_LOCATION for the specified violation row in order to effect any changes to the CPAYMENT table.

##### 2.10.2.9.1 Add/Update

To add or update the Payment file, TRANS\_CODE must = **C**.

- To update the Payment file, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** PENALTY TYPE **plus** PAYMENT SEQ must exist in the CPAYMENT table.
- To create a new CPAYMENT row, the key columns concatenated together must **not** currently exist in the CPAYMENT table.

##### 2.10.2.9.2 Delete

To delete a CM&E Payment file, the C9 flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** PENALTY TYPE **plus** PAYMENT SEQ are provided.

#### 2.10.2.10 CA (CLN\_COMPLIANCE\_SCHEDULE) Flat File

CLN\_COMPLIANCE\_SCHEDULE data is variable IOR; the decision field is *Agency*. The translator must be the responsible agency owner for the given ACTIVITY\_LOCATION for the specified evaluation row in order to effect any changes to the CLN\_COMPLIANCE\_SCHEDULE table.

##### 2.10.2.10.1 Add/Update

To add or update a Compliance Schedule link, TRANS\_CODE must = **C**.

- To update a Compliance Schedule link, a replacement for the entire row must be provided. Column-specific updates will not be supported. A row owned by the translator matching the key columns HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** DETERMINED\_BY\_AGENCY **plus** VIOLATION\_SEQ must exist in the CLN\_COMPLIANCE\_SCHEDULE linking table.
- To create a new CLN\_COMPLIANCE\_SCHEDULE row, the key columns concatenated together must **not** currently exist in the CLN\_COMPLIANCE\_SCHEDULE table.

##### 2.10.2.10.2 Delete

To delete a CM&E Compliance Schedule link, the CA flat file must contain a record where TRANS\_CODE = **D** and the key fields HANDLER\_ID **plus** ACTIVITY\_LOCATION **plus** ENFORCEMENT\_DATE **plus** ENFORCEMENT\_SEQ **plus** AGENCY **plus** DETERMINED\_BY\_AGENCY **plus** VIOLATION\_SEQ are provided.

Rows in the C5 (CENFORCEMENT) flat file, the C6 (CMEDIA) flat file, the C7 (CSEP) flat file, the C8 (CPENALTY) flat file and C9 (CPAYMENT) flat file representing the Delete CM&E Compliance Schedule link transaction must **NOT** be included. Deleting a CM&E Compliance Schedule link row from the CLN\_COMPLIANCE\_SCHEDULE link table will automatically *cascade delete* any associated row(s) from the CENFORCEMENT table, the CMEDIA table, the CSEP table, the CPENALTY table and the CPAYMENT table. Related delete transactions in those flat files will cause the translator load process to terminate because the data will have been previously deleted.

## APPENDIX A: Flat File Specifications

### FLAT FILE NAMING CONVENTIONS

Flat file names are constructed in the following manner:

SSFFNNNs.FIL

Where:

SS	=	State Postal Code
FF	=	Flat File Identifier (eg., P1 or P2)
NNN	=	Julian Date when file was created.
s	=	Sequence indicator for Flat File

**Note:** The two-character Flat File Identifier distinguishes each flat file produced during the translation. For example, the correct name for the first P1 file, containing AL data, produced on January 4<sup>th</sup>, is ALP1004A.FIL.

# FLAT FILE ID# - CL

Table Name:		All								Record Length: 28	
Description:		Control File - Name & statistical information for each flat file submitted.									
No.	Pos.	Field Name	Key	Type	Size	Sort	Nat. Req.	Sys. Req.	Edit #		
1	1	FLATFILE_NAME	N	Text	12		N/A	Y	CL010, CL012, CL014, CL016		
2	13	SOFTWARE_VERSION	N	Text	1		N/A	Y	CL020		
3	14	DATE_CREATED	N	CCYYMMDD	8		N/A	Y	CL030		
4	22	RECORD_COUNT	N	Integer	6		N/A	Y	CL040		
5	28	FULL_REPLACE_IND	N	Text	1		N/A	Y**	CL050, CL052		

**NOTES:** All text data in the Control File must be in upper case.  
 ACTIVITY\_LOCATION and identity of translator will be derived from translator load job submittal process.

# FLAT FILE ID# - H0

Table Name:		HBASIC			IOR Type:		Fixed		
Description:		Handler Basic Identification			Record Length:		306		
No.	Pos.	Field Name	Key	Type	Size	Sort	Nat. Req.	Sys. Req.	Edit #
1	1	TRANS_CODE	N	Text	1		N/A	Y**	CL050, CL052
2	2	HANDLER_ID	Y	Text	12	1	Y*	Y	H0000, H0002, H0010, H0012, H0014, H0016, H0018

## APPENDIX B: TRANSLATOR DATA ASSESSMENT EDITS

ERROR #	FIELD NAME(s)	MESSAGE	LOGIC	NOTES
<b>Control File (CL) Edits</b>				
CL010	FLATFILE_NAME	Invalid State Code in FLATFILE_NAME	First two characters of FLATFILE_NAME NOT valid State Postal Code. If <b>True</b> , set ABORT_FLAG = <b>ON</b> Continue.	; PRE-LOAD ERRORS All edits on control file columns are <i>pre-load</i> edits. This means that if an error(s) is detected, the translator load process will not continue.
CL012	FLATFILE_NAME	Invalid Flat File Identifier in FLATFILE_NAME	Characters 3 and 4 of FLATFILE_NAME NE 'CL', 'H0 - H8', 'HA - HE', 'P1 - P5', 'A1 - A6', 'C1 - C9', or 'CA'. If <b>True</b> , set ABORT_FLAG = <b>ON</b> Continue.	
CL014	FLATFILE_NAME	Invalid Julian Date in FLATFILE_NAME	Julian Date NE numeric value derived from DATE_CREATED. If <b>True</b> , set ABORT_FLAG = <b>ON</b> Continue.	
CL016	FLATFILE_NAME	FLATFILE_NAME previously processed.	FLATFILE_NAME NOT unique for a given Julian Date. If <b>True</b> , set ABORT_FLAG = <b>ON</b> Continue.	Sequence indicator is used to differentiate multiple flat file load submissions on the same day.
CL020	SOFTWARE_VERSION	Invalid SOFTWARE_VERSION	SOFTWARE_VERSION NE first digit of RCRAInfo software version. If <b>True</b> , set ABORT_FLAG = <b>ON</b> Continue.	
CL030	DATE_CREATED	Invalid DATE_CREATED	Not valid date OR when converted to Julian Date is NE Julian Date supplied in FLATFILE_NAME. If <b>True</b> , set ABORT_FLAG = <b>ON</b> . Continue.	
CL040	RECORD_COUNT	RECORD_COUNT NOT= actual record count in flat file.	RECORD_COUNT NE actual count of records submitted for FLATFILE_NAME Flat File Identifier If <b>True</b> , set ABORT_FLAG = <b>ON</b> , Continue.	

ERROR #	FIELD NAME(s)	MESSAGE	LOGIC	NOTES
CL050	FULL_REPLACE_IND, TRANS_CODE	FULL_REPLACE_IND=Y, TRANS_CODE not blank.	FULL_REPLACE_IND in Control (CL) File = <b>Y</b> AND TRANS_CODE in any flat file record for a module NE <b>Blank</b> . If <b>True</b> , set ABORT_FLAG = <b>ON</b> , Continue.	
CL051	FULL_REPLACE_IND	FULL_REPLACE_IND must = Y, N or blank	FULL_REPLACE_IND in Control(CL) File NE <b>Y, N</b> or <b>blank</b> If <b>True</b> , set ABORT FLAG = <b>ON</b> , Continue.	
CL052	FULL_REPLACE_IND, TRANS_CODE	TRANS_CODE NOT= C or D	" FULL_REPLACE_IND in Control (CL) File = <b>Blank</b> AND TRANS_CODE in any flat file record for a module NE <b>C OR D</b> . If <b>True</b> , set ABORT_FLAG = ON.  " CONTROL FILE just validated is control file for last flat file submitted. If <b>True</b> AND ABORT_FLAG = <b>ON</b> , Abort translator load. If <b>True</b> AND ABORT_FLAG NE <b>ON</b> , continue to other flat file edits. If <b>False</b> , validate CONTROL FILE for next flat file in series.	
<b>HBASIC (H0) Edits</b>				
H0000	HANDLER_ID	Invalid State Code for &handler_id	First two characters of HANDLER_ID NOT valid State Postal Code. If <b>True</b> , reject record.	First two digits of a Handler ID must always be a valid state prefix.
H0002	HANDLER_ID	State prefix for HANDLER_ID NOT = state being processed.	First 2 characters of HANDLER_ID NE 1 <sup>st</sup> two characters of FLATFILE_NAME. If <b>True</b> , reject record.	First two characters of HANDLER_ID must be same as state being processed.
H0010	HANDLER_ID	Not IOR for HBASIC block for &activity_location.	Match first 2 characters of HANDLER_ID against ACTIVITY_LOCATION in TSIMPLEMETER_OF_RECORD table where tablename in TSIMPLEMETER_OF_RECORD = HBASIC. Determine if AUTHORIZED_AGENCY NE owner group for Translator. If <b>True</b> , reject record.	HBASIC data can have one owner per state prefix.

ERROR #	FIELD NAME(s)	MESSAGE	LOGIC	NOTES
H0012	HANDLER_ID	&handler_id exists in HBASIC; Cannot add.	TRANS_CODE = <b>Blank</b> AND row matching HANDLER_ID exists in HBASIC table. If <b>True</b> , reject record.	This checks for duplicate flat file records.
H0014	HANDLER_ID	Unowned data linked to HBASIC; Cannot delete &handler_id.	TRANS_CODE = <b>D</b> AND row matching HANDLER_ID exists in HBASIC table AND an unowned data row (s) is linked to any row in any table associated with that HANDLER_ID. If <b>True</b> , reject record.	
H0016	HANDLER_ID	<b>WARNING:</b> HANDLER_ID &handler_id fails algorithm check.	(TRANS_CODE = <b>C</b> OR <b>Blank</b> ) AND row matching HANDLER_ID NOT in HBASIC table AND HANDLER_ID fails check-digit algorithm. If <b>True</b> , display warning message, set <b>Warning Flag</b> for later use.	Allows implementers to add State ID numbers which don't pass federal check-digit algorithm to the database.
H0018	HANDLER_ID	&handler_id missing in HBASIC; Cannot delete.	TRANS_CODE = <b>D</b> AND row matching HANDLER_ID NOT found in HBASIC table. If <b>True</b> , reject record.	
H0020	HANDLER_NAME	HANDLER_NAME cannot be blank	(TRANS_CODE = <b>C</b> OR <b>Blank</b> ) AND HANDLER_NAME = <b>Blank</b> . If <b>True</b> , set ERROR_FLAG = <b>ON</b> , Continue.	If field fails edit, software applies remaining edits to other fields in record. At END, if ERROR_FLAG = <b>ON</b> , reject record.
H0030	EXTRACT_FLAG	EXTRACT_FLAG must be blank or 'X'	(TRANS_CODE = <b>C</b> OR <b>Blank</b> ) AND EXTRACT_FLAG NE <b>Blank</b> . OR ' <b>X</b> ' If <b>True</b> , set ERROR_FLAG = <b>ON</b> , Continue.  If ERROR_FLAG = <b>ON</b> , reject record.	
–	FACILITY_IDENTIFIER	–	–	No edit on this data column.
–	NOTES	–	–	No edit on this data column.
<b>HHANDLER (H1) Edits</b>				
H1000	ACTIVITY_LOCATION	Invalid ACTIVITY_LOCATION.	ACTIVITY_LOCATION NE 1 <sup>st</sup> two characters of FLATFILE_NAME. If <b>True</b> , reject record.	ACTIVITY_LOCATION must be same as state being processed.

ERROR #	FIELD NAME(s)	MESSAGE	LOGIC	NOTES
H1010	HANDLER_ID (FK_HBASICHANDLER_ID), ACTIVITY_LOCATION	Not IOR for HHANDLER block for ACTIVITY_LOCATION &activity_location.	Match ACTIVITY_LOCATION in H1 record against ACTIVITY_LOCATION in TSIMPLEMENTER_OF_RECORD table where tablename in TSIMPLEMENTER_OF_RECORD = HHANDLER. Determine if AUTHORIZED_AGENCY NE owner group for Translator. If <b>True</b> , reject record.	HHANDLER data can have one owner per ACTIVITY_LOCATION. HHANDLER data is fixed IOR within the context of a Region/State pair for a particular ACTIVITY_LOCATION.
H1012	HANDLER_ID (FK_HBASICHANDLER_ID)	Ref. Integrity Viol. (HBASIC and TR_HBASIC); Cannot process HHANDLER record.	Row matching HANDLER_ID NOT found in HBASIC or TR_HBASIC table. If <b>True</b> , reject record.	Referential integrity check.
H1014	HANDLER_ID (FK_HBASIC_HANDLER_ID), ACTIVITY_LOCATION	HHANDLER row exists; Cannot add.	TRANS_CODE = <b>Blank</b> . AND row matching HANDLER_ID AND ACTIVITY_LOCATION exists in HHANDLER table. If <b>True</b> , reject record.	This checks for duplicate flat file records.
H1016	HANDLER_ID (FK_HBASIC_HANDLER_ID), ACTIVITY_LOCATION	HBASIC owner cannot delete HHANDLER row.	TRANS_CODE = <b>D</b> . If <b>True</b> , Match first 2 characters of HANDLER_ID against ACTIVITY_LOCATION in TSIMPLEMENTER_OF_RECORD table where tablename in TSIMPLEMENTER_OF_RECORD = HBASIC. Determine if AUTHORIZED_AGENCY = owner group for Translator. If <b>True</b> , reject record.	
H1018	HANDLER_ID (FK_HBASIC_HANDLER_ID), ACTIVITY_LOCATION	HHANDLER row not found; Cannot delete.	TRANS_CODE = <b>D</b> AND row matching HANDLER_ID AND ACTIVITY_LOCATION <b>NOT</b> found in HHANDLER table. If <b>True</b> , reject record.	
H1020	OWNER (FK_LU_COUNTYOWNER)	COUNTY CODE Owner must = HQ.	(TRANS_CODE = <b>C</b> OR <b>Blank</b> ) AND (OWNER NOT = <b>HQ</b> ). If <b>True</b> , set ERROR_FLAG ON, Continue to LOCATION_STREET1 edit (H1030).
